Two markers would be great and three even better. I have a small
Micor repeater in the basement made from old junk.
The only thing new was the controller I put on it years ago. I like
to experiment with filters etc and the sa
is a tool I always wanted. Redid the duplexer yesterday and it worked
great when I was finished. Still have a
lot to learn about the 8924c. When I feel more comfortable with the
controls, I will start using RF TOOLS.
By the time Iam finished, I probably will wear the threads on the
type N connectors off!! The cavities were
either old Sinclair bp or reject out of old ring hybrid duplexers
modified with reject loops.

Thanks, another step forward.

I have a 8924c and one of those old duplexers, would you care to share how you built the reject loops? Did you reuse the sliding Caps?

Thanks Ralph I think I got it. I was able to go to position and move
it around just like I want to..

Glad that helped you .

For the duplexers, are you playing around with a return loss bridge ?  This is mainly a SWR meter when used to adjust the pass part of a band pass /band reject  type duplexer.
I have found a Mini-Circuits ZFDC-20-5 works well for adjusting the duplexers and is priced way under the other ones.

For most things the RF Tools that HP/Agilent puts out is not too much use.  There is one thing that measuers the distance to a fault that can come in handy.

That 8924c does so much and I have not seen a good manual for it.  As many have mentioned the one for the 8920 is close, but you have to convert some of the buttons from one to the other  and is confusing at times.

If one has a good understnding of test sets and the results you should expect to see, you can press buttons and see what hapens.  If this is the first good test set that you have ever played with, it can be a real pain to learn.

I do not work on radios for a living, but did work for a company as an instrument technician.  Got to play around with many differant test sets for general plant instrumentation.  By knowing how many of them work, it gave me a good insite into how to play around with the 8924.

I bought the 8924 to set up a couple of ham repeaters and also to play around with at home.  It seemed to be the cheapest set that I could find that had the spectrum analizer and tracking generator.
Before that I was using a Singer FM20 and some older analog signal generators like the one in he old GE Mastr ll manual.

Hello Jim. They are quite easily done.I have used a variety of
capacitors, from small air type ceramics, Microwave
piston and the best, Johanson (sp??) piston. These are the same caps
that Sinclair used in the more modern
duplexers. I was able to pick up a few at Dayton a number of years
ago. Found out that if you can get hold of
a scrap dual port isolator, they have a few of the 30pf units in
them. I have made the loops out of just
about any kind of solid copper wire you can get a hold of. Bare or
otherwise. Also strips of hobby brass that
you can buy at a model airplane shop. I experimented with the loop
size and also there was an article by
a club in Ottawa Ont. that was on the net I think. That was a long
time ago. The other thing to do is undo
the cold end of the present loop and insert the trimmer cap. Grid dip
it and it should tell you if it might
work. Originally I made cavities up to isolate the packet from the
repeaters. Then on to make a duplexer.
One of the things I noticed yesterday was that a pass cavity between
the tx and rx ports spaced a little
less then a quarter wave improved the rejection by a good 5db. I had
these on originally with a half wave
spacing and wasn't happy with the results. If you go on the net and
google ve2azx you should find one of
the better articles on cavities that I have read.

By the way, a friend of mine and I re did a hybrid ring duplexer from
the 150mhz band to the ham band
in a CATV test lab. Using linear catv amps to extend the range of the
textronic equipment we were using.
It was excellent. We ended up soldering all the cable junctions
together to improve rejection etc. Also,
I resized all the cables the hard way. No crimp!! That was about 40
years ago. Duplexers were hard to come
by.

With the tuned loop Jim you do not need the sliding caps.

Give it a try Jim, it is very interesting and can be very rewarding..

I got to use a lot of the old stuff but as one moves up in a union
shop one doesn't get to touch the new stuff. You
budget for it but you don't touch. Since I retired 20 years ago, I
have been slowly trying to get some of the new stuff.
I have had the gertsch (sp) fm3, fm10 and also a Marconi 1066b also
an 80r. I do have a hp dual trace 50mhz storage
scope I picked up a number of years ago.. I also have a senger fm10c

which I have been using for a few years. The only new
stuff I was able to get into was the Microwave Link Analyzer. Nice
test set don't know how ever operated with out them.
And a few HP400

I am looking for a return loss bridge now. I think that will be my
next purchase. I remember doing IF return loss years
ago and when I look at this application it is very similar, just
different stuff. The results would be the same. I use
HP400el type voltmeters for noise quieting tests. Most of the stuff
was surplus to the telephone company as they moved
into the digital world. Using the SA takes a lot of the quess work
out of tuning. You can still do it without as long as
you test, test, and test. You can get the same results.

Have you tries to power it through DC? Are you sure the AC/DC switch is not flaky?

Don't have info beyond that. I thought mine was dead once, but I just accidentally flipped the AC/DC switch.

Ralph, if your AC/DC key is OK, maybe the problem is the 470K resistor near of panel and keys, on the primary supply. Normally it is open... You should to check it. (I don´t remember but I think that you should have care because maybe a one side is with high voltage...)

I couldn't find anything on the A9 Power Supply module, but did find this
doc on A's web site that does have schematics for many of the other
assemblies. Makes me wonder of the base power supply was a purchased unit
and they didn't have a schematic for it. The closest it comes is that it
does have the A10 regulator module schematic.

My guess is that RT is a Thermistor; maybe used to shut down if air flow
isn't high enough?

Here is the link to that doc...

# 1237. 8924 & E8285 - replace the power supply caps!!

Yahoo group: hp8924
Date: 2012-11-29 21:12:57 UTC
From: c_day_nz
Topic: 1237  Message: 1237

I have repaired a few 8924C & E8285A with a range of faults from unlocked synth's, wandering reference, intermittent power up, no power up, Etc. All have been power supply issues caused in the main by bad electrolytic caps. In E8285 PSUs also check U2 (LM317HVT) which when fails causes no/lo +40v rail & unlocked synths. Once the caps were changed, all other symptoms were cured and they calibrated up perfectly. Replacing the caps is time consuming but well worth the effort. If your paying someone to repair a faulty supply, don't do it unless they will be also changing out the caps or you'll be sending it back in 6/12/24 months. Make sure the caps used are rated for 105C. Also clean the cooling fan/s and remove as much dust as possible from the chassis while you have it open. If its a CRT model and the display is not right (wobbly, brightness/contrast issues, etc), change the display electros. If its a plasma display, replacing the high voltage eletros on the plasma PCB fixes some problems. This advise will also be relevant to the HP / Agilent 8920, 8922 & 8935 series of com test sets. 73s de Chris ZL1CVD.

# 1238. Re: HP 8920 Not 8924

Yahoo group: hp8924
Date: 2012-11-30 14:27:30 UTC
From: jyelmgren
Topic: 1220  Message: 1238

This is a good basic question on switching power supply design ..see below from a manufacturers application note on digikey

"The NTC thermistor can be a cost effective device to
limit the amount of inrush current in a switching power
supply or other devices when the power is first turned
on. For switch-mode power supplies, the large filter
capacitors present in the circuit appear as a short circuit
at turn on. During this period a large amount of current
flows through the circuit until the capacitors have had
time to become fully charged. At that point in time, the
amount of current will have dropped substantially."

What this implies is that the main filter caps are "leaking" and pulling too much current even when charged which will burn out the thermistors over time.

Replace the input filter caps ..sounds like you may have already shipped this out though

Yes I have shipped it to Power Clinic. They are going
to calculate the inrush and install the correct Surgesistor
and change all the Caps. They can change the caps at a lower
cost than I. If I knew the correct surge device I would have
changed it and moved on. This way someone who does this
everyday can do the repair.
Thanks for the information.
Ralph

Subject: [hp8924] Re: HP 8920 Not 8924

This is a good basic question on switching power supply design ..see below from a
manufacturers application note on digikey

"The NTC thermistor can be a cost effective device to
limit the amount of inrush current in a switching power
supply or other devices when the power is first turned
on. For switch-mode power supplies, the large filter
capacitors present in the circuit appear as a short circuit
at turn on. During this period a large amount of current
flows through the circuit until the capacitors have had
time to become fully charged. At that point in time, the
amount of current will have dropped substantially."

What this implies is that the main filter caps are "leaking" and pulling too much current
even when charged which will burn out the thermistors over time.

Replace the input filter caps ..sounds like you may have already shipped this out though

Normally you have two thermistors...one in the plus and the other in the negative of the input bridge rectifier output.
Usually only one will burn out completely so that measuring the other one will give you the replacement value.
Not a super critical component value ...close enough should work fine since its main purpose is to just limit the turn on surge.

Topic: 1220  Message: 1242

Hi,
In my experience it'e unusual to find two inrush limiting NTC thermistors in single phase power supplies. There is no reason to use two as they would be in series.

Robert G8RPI.

That's pretty much designer's choice.

Just fixed a R 2001D that popped a thermistor due to leaky caps and it had a dual thermistor design.

Seen them both ways though but it may depend on how they handle the range switching for 100VAC to 200VAC on the input.

# 1244. HP8924 Uncalibrated Accuracy

Yahoo group: hp8924
Date: 2012-12-10 19:42:13 UTC
From: wb5nfc
Topic: 1244  Message: 1244

I've owned my 8924 for a few years now, but I'm just now getting serious about using it for duplexer tuning and other duties. Mine came via the surplus market, so it was not recalibrated upon purchase. All initial start-up testing is normal, but I'm just wondering if there is a way to ensure accuracy "close enough for amateur work" without a trip to a cal lab?

Thanks.

John / WB5NFC

# 1245. Re: [hp8924] HP8924 Uncalibrated Accuracy

Yahoo group: hp8924

From: Ralph Mowery
Topic: 1244  Message: 1245

Chances are that if it works at all and no one has messed with the calibration, it will be plenty close enough for ham usage.

The frequency is easy to check out.  Hook it to an outside antenna and tune in WWV at 20 or 15 MHZ.  It should read out the frequency to the last place.  Even if it is 2 cps off, that only equates to 20 to 40 hz off at 150 mhz.  I checked the output of several 2 meter repeaters and have found them to be off from a hundred to almost 1000 cps from the nominal frequency.Some that much low to that much high.  So even if my 8924 is off some, that would put atlest some of the repeaters off more that 1000 hz.
I bought one about a year ago and it was not calibrated either.  The 8924 reads out WWV at 20 mhz to the last 0 and it may bounce down once and a while to 19 an all 9s..  There could be that much doppler shift as the signal bounces around.

You may compair the output power to a couple of receivers and see if it is close to what the receivers are rated for.  I have a Motorola generator that is probalbly 40 years old and the output on it compairs very well with the 8924.  That is the old one like some of the GE Mastr ll books have in it.

If you want to  check the FM deviation of the generator part, set it up with the spectrum analizer to look at the output.  Then as you increase the deviation you can see the 'carrier' dissapear.  I think that it is about 2.4 times the audio frequuency where it should dissapear.
Look up Bessel function for a detail on this.

For tuning the duplexers,  all you need is to be close to the frequency.  Most everything else is for maximum or minimum.  When you normilize the 8924 for the loss in a duplexer, this should put it close enough to see if you have too much loss.

There are some more self checks you can make from the various menues in the 8924.

Unless you find someone that has a service monitor that just came back from a calibration lab, the 8924 is probably more accurate than most of the service monitors in use even if it has not been calibrated in years.

The good thing about the ham bands is that you only have to be somewhere in the band to be legal. Not that you would not want to be as close as you can.

# 1247. Re: RF Tools

Yahoo group: hp8924
Date: 2012-12-11 01:03:27 UTC
From: jyelmgren
Topic: 1199  Message: 1247

looked at the code in the NA_FM.pgm that errors out on the 8924C.

It has a number of places it looks at the model to set variables.

Have not had a chance to try this but was going to change the instances of 8920B to 8924C and see if that corrects the error. Picked the 8920B model to switch since that should be closest to the 8924C.

My guess is that it's trying to set some variables based on model ..8920A. 8921A or 8920B and when the model does not match a variable is left with the wrong or no value set.

Thought someone may have a chance to try this before I get a chance around the holidays.

Topic: 1244  Message: 1248

The two main things to look at are frequency and the reference voltages on the measurement unit (+ & - 5V rails). I use a Trimble Thunderbolt (GPS locked 10MHz reference) and older HP 6 digit multimeter. You'll probably be able to pick up both for less than the cost of calibration.
Once the reference frequency is set (& don't forget the warm-up period ☐ my 2x 8924's take at least 40 minutes to stabalise), the internal ROM procedures PER_CAL3, CDMA_CAL, and PCB_CAL are used to set everything else up. From what I can see, the 8924C is designed to be self calibrating once its time base and voltage reference are set. Great kit for the shack. Cheers & 73s Chris.

Most of the cables you will need is just jumpers that fit the connectons on the 8924C and whatever you want to hook it to.  Double shielded if possiable when doing low level signal duplex testing.

If you do not know it, the 8924c book is about useless for most things.  However the book for the 8920 is what you want to look for .  The buttons you press on the two are marked differant,but they are similar.  The screens are almost the same for the two units.

I had read that about the book on the 8924c...but I did download a copy of the 8920 book.

Thanks for the info.

I'm also looking at the 100 watt upgrade info in the files section...mine is only rated for 3w. I can use an external attenuator in the mean time.

If that 100 watt upgrade is the one replaceing the input attuenuator, it is worth while.  I did the factory upgrade to a 60 watt unit but it will take around 100 watts for about 10 or 15 seconds.  Only takes a couple of minuits to do the mechanical job of replacing the attenuator pad, but half an hour to get to it by removing all the screws and shielding.

Hi Ralph.

I have a 3 watt unit with a 20 db, 100 watt external attenuator. The attenuator can stand 100 watts for several hours and I don't have to worry about over stressing the internal load. There's an option in the configuration menu that I adjust to compensate for the attenuator and its calibtated to measure rf power accurately. Where the RF analyzer begins to rolls off at 10 MHz, I even have it calibrated to measure power levels at 3, 7 and 10 MHz. I have configurations saved for each frequency with the proper attenuation, calibration, mode and signal levels. There's a photo of my setup in the files section.

yes, Jack the external attuenator is a good way to go.  Especially if you do not want to dig into the 8924c.
Knowing my luck I would hook a transmitter up and forget the external stuff.  Also just something else to forget when  I do carry it to the repeater.

I do have one of the 250 watt dummy loads that has the built in tap that cuts the power to that port by about 40 db depending on the frequency.  If I do not forget, I try to carry that along to the repeater site.

Good move about saving the setups for power levels below 10 mhz.  I have not thought about that, but seldom measuer anything that low.  Have been dragging out another wattmeter when I do.
That is one nice thing about the 8924c.  If you do something very often you can set it up in the memory and a button push or two is all you need.

Here is wht I have from a while back.  You should be able to find it at thease places if it is still there.

If changing the file extension to MP4 doesn't work, you might need to DL it again. It should play in most any version of VLC or GOM.

Slight change of plan. Being as my webhost is not cooperating with the single large file, I removed it. In place, I added another set of smaller pieces to DL. These are from WinRAR, for those familiar with that, and should reassemble using either WinRAR or 7-Zip. Just another option to the original set that Joe created. They can be found here…
http://grovesnet.org/Downloads/

For those interested in getting it in one chunk, Jim has kindly uploaded it to his site here (and it's working much better than mine did)…

Hello, Tom and the group--

Please don't bail out of the group-- odds are good that someone
can download the file and copy it to a CD-ROM for you.

This web site...

http://pcsupport.about.com/od/fileextensions/f/m4vfile.htm

...Describes how to open a file with an "m4v" extension.
Take a look at it and decide whether your PC would be
capable of opening the file. You might need to download
an appropriate file viewer if you don't have one.

After taking a look at the web page given above, please
respond to the hp8924 group. If you need the file on a CD,
one of us can mail it to you. (I'd offer to do so, but we
have an immediate and ongoing family crisis at present.)

Tom it does not take that much of a computer to download the file.  It does take a DSL or cable modem.  I don't recall how long it took me, but probably an hour or two with a cable modem.  If you have that, you can always start it downloading and go to bed and get it in the morning.

Reminds me of using the 56 k modem on the telephone and downloading some of the 20 meg files.  Went and got a haircut and a few other things and when I got back home, it was still downloading.

If you have the 8920 or 8924C you are already in the club.

Lots of useful information here and enjoyed browsing the site BUT if you're starting to talk about downloading GIGABIT sized files this is no place for me.  I DON'T have and WILL NEVER HAVE a computer capable of doing this so, I guess, its time I leave.  Sorta like me hanging out with millionaires, I JUST DON'T BELONG.

Tom I put a mailer with 2 cd's in it.  They are the DVD type as the file was too big to fit on a regular CD.  I hope you have a computer that will play the DVD.

One DVD just has the vidio file on it.  The other has that file plus a lot of other files that I have for the 8920 and 8924c units.

I do not know, but do not think the DVD will play on a regular TV DVD player.  I have never tried that in a regular DVD player hooked to the TV.  The file will play on a computer with the program Real Player or another one called VLC Media Player.  Both of them are free programs that you can download if you do not have them. It may play with ohters, but I have not tried that either.  Most of the other files are PDF or text or JPG pictuer files that you should not have any probelm with.

Tom,

We're not millionaires, if we were, we would belonge to the Rhode & Scwharz group and own a $50,000 MW500 communications analyzer. Most of us paid under $1,000 or under $500 for broken unit. We share information and help each other with repair problems and operating tips.

All,
Thanks for the kind replies. Guess I was a little overdramatic the other day but I've been dealing with one of my Shelties that is dying of kidney failure so my morale is at an all-time low right now. Probably not likely to improve for a while.
Ralph, thanks for making those CDs for me. I do have a DVD player in this computer and a CD writer so I should have no trouble seeing them. My problem is the hard drive. Its only a 10Gig drive and I've been squeaking by with only an average of about 8% free space. I've been looking for a 40 to 80 gig drive to replace it but, so far, no luck. The smallest one I've been able to find on the auction site is 120 gig. Its only about $20 but I don't think this old P3 computer will support that. I missed out on two 60 gig Seagate drives by about a half hour. When I got back from lunch, they were gone. Guess that'll teach me to put lunch first! Getting really hard to find any drive that isn't serial ATA anyway.
Thanks again and, in the future, I'll try to keep my "cheery" comments to myself.

Tom the DVD is on the way.  I put it in my mail box yesterday about 11 as the mail usually comes after 12.  Wouldn't you know it, for the first time in several years it went before 11.  Anyway it was picked up today so if it does not get lost in the snow you should get it soon.

Sounds like you need to do like I did several years ago and get a used computer off ebay. You can often pick them up for less than $ 100 shipped. That is without the monitor. That even included the Windows XP system and disc and the Microsoft number for the disc.  What do they call that ?  Maybe the COA..

I am almost a millionair so sent you the disc.  Have about a buck 98 in the checking accountg..hihi..  That leaves me just under 999,998 short of that million..

I don't recall, if you said, but do you have a 8920,8924 or what ?  There are several sets that are very similar to the way they work and the looks of the screens.

# 1266. back on the subject of cables...

Yahoo group: hp8924
Date: 2012-12-30 17:11:46 UTC
From: Jon
Topic: 1266  Message: 1266

Considering my unit came with no cables...
Do most assemble their own cables ? I understand the need for double shielded coax.
So is a good rg-8x sufficient or rg-142 better ? I know LMR series in full duplex service is bad. I assume that
it is not the best for testing either.

I figure a complement of cables N-Male to what ever you typically connect to. (pl-259, sma, reverse sma, bnc, mini uhf, tnc, f).

I located the proper series for the oscilloscope probes..

Any special leads for the volt meter functions ?

73,
Jon

I would thing that most do make their own cables.  If you are not doing duplexer tuning, the single shielded cables are fine in most cases.  I do have some double shielded cables I made up out of double shielded cable.  I do have several cables with bnc on one end and N or pl259 on the other end.  Most are made out of double shielded cable as I picked up some with N connectors on them for almost nothing at a hamfest.  They are about the same size as rg8X on the outside diameter.

One thing I do to make it easy it to put a wrap or two of red electrical tape near the connector on each of the double shielded stuff.  Makes it quick to find them among all the other coax.

I think it is the RG-400  ( not LMR -400 ) that is double shielded with a stranded center conductor.  You may want to get or make a few  cables like that about 4 to 6 feet long.

While maybe not the best, I have a bunch of adapters to go from one type of connector to another.

I am thinking the oscilliscope is not good for over 1 mhz.  Maybe less. If so the lead is not that critical.  I do not use that function on mine.

The volt meter is only good for low voltages and I do not use that either as I have a good digital meter.

I do have a bnc connector that has some coax the looks to be about the rg 174 size with alligator clips on the other end for doing sinad tests.

They are nice to have.  I do have a set like that I picked up cheap.

Only problem for me is that I only have enough cables to make up one of each. It would be nice to have enough connectors to make up two cables with the same ends on them.  They do come in handy when I do not have a cable with the correct ends on them.

I often think that for the work I do I like to have cables that are atleast 6 feet long.

Hi

i Just picked up a 8924c for xmas to myself and have have found lots of great info in this group, i will adding a vga monitor and doing a 100w upgrade,

I found the 11807Eopt100 in the file section and thought i would load it up, but with no PCMCIA card i was out of luck, until i found this hp drive emulator
http://www.hp9845.net/9845/projects/hpdrive/
i was successful in mounting a 640k (9122)drive and also a 40mb(9133L) drive being able to format , read and write to them. i am also able to run the hp rftools . The parts of the program that save plots and data are set to the card slot, so you would still need a card to save. although i have played around a little with the ibasic code to get it to save to disk or memory with some limeted success, but it needs work. i will upload a floppy image with rftools for those wishing to try this out.
* note the files take a few minutes to load to the 8924 so if nothing is happening its working *

Hi and welcome to the group.
For those not fortunate enough to have a working 91xx disk drive, the website you mention also has a drive emulation program. It just needs a PC and an HPIB card.
For anyone interested, I'm still offering the 11807E OPT 100 RF tools on a PROM PCMCIA card to group members at a discounted price of $60 inc Shipping. (contact me off-list).

Happy New Year,
Robert G8RPI.

Thanks for the work on this.  I used Word to edit the program and load it on a card.  I could not check it on transmittt with what I was using, but the receive parts seems to run just fine.

The version of softwear on my 8924C is the same as yours.

I thought it would be simple for someone that knows how to program in HP Basic.  Well, the fix was simple, but bet you spent a good bit of time searching the program.

B. Use the POWERON register

C. Set squelch control on in customize test procedure: Set up frequencies and any othe parameters you need

D. turn on Data collection if you want to get a file (i will upload the manual

E. Run the program

good luck

# 1279. duplexer cable

Yahoo group: hp8924
Date: 2013-01-13 13:35:11 UTC
From: wd0ekr
Topic: 1279  Message: 1279

I know that this has already been discussed in the past but I would like to confirm something. If I measure the frequency of a .66 VF Sinclair 202g cable with the 1/4 wave coaxial filter tuning setup and then make a cable with .695 VF coax that centers up on the same frequency it should work on the duplexer, am I correct in assuming this? I am building the duplexer from can's that are minus the harness. I have the measurements for the factory rg-214 harness but I want to use rg-400.

As far as I know in theory it should...provided you are adjusting for the difference in velocity factor..although small.

HI

i recieved my gbs-8200 and hooked it up without the sync circuit and it seems to be working fine with just adding the resistors, would i see a benifit in adding the sync circuit?

# 1282. HP 8920A Firmware Images

Yahoo group: hp8924
Date: 2013-01-15 20:11:47 UTC
From: Keith
Topic: 1282  Message: 1282

Anyone have the last firmware images for the 8920A? I'd like to update my unit but have had ZERO luck in locating them. I have a data i/o unisite to burn the proms so that's not an issue, locating the files is a different matter. Thanks for any leads or information or help! This is a great forum. I've built the VGA adapter for my monitor and helped a friend update his 8924C to 100 watts which wouldn't have been possible without the great info here. Thanks!

Does any one have the rubber keypad for an 8924C?
This is the rubber sheet that goes between the front panel and the keyboard/encoder board.
I have an 8924C that is coming that has this part missing.
I can cut up the keypad from an 8922, but would like to get the correct keypad.
Any help appreciated.
I would settle for a replaced keypad from an intermittent keyboard.

Thanks

Update:

I added the sync circuit and it makes the display rock solid, thanks for all the info on this site. Just waiting for the 20db 100w pad to arrive and im all set.

p.s. i have modifided the calabration files to run on my emulated drives, as i still don't have a sram card and can upload to file section if anyone is interested.

# 1291. New Member! and Mic Pin-out

Yahoo group: hp8924
Date: 2013-01-22 04:27:05 UTC
From: Nicholas
Topic: 1291  Message: 1291

My name's Nick and I have recently purchased a 8924c on the ebay and it's on it's way! I'm trying not to be the poor man who pays twice to calibrate radios.

So to avoid spending $300-700 on a new mic, can someone point me to the mic/accy port pin out? A cursory search revealed nothing.

And I'm looking to test some P1225 radios and similar family with no obvious ground. Do I just jerry rig an RF connector to the RF hot and electrical ground? Or just give up and measure over the air?

I can't get it copy the drawing of the connector so I can send it to you, but the 8920  is very close to the 8924c. If you do not know it, look for a manual of the 8920 as that tells more about how to use the set for non cell phone testing.  You will have to watch what the buttons are called as some are labled differantly and are in differant places on the two sets.

If you download the 8920 manual 108920-90221.pdf which is probably in the files section here or you should be able to get it from the Agilent web site, look on page 580 for the picture of the connector.

If you start at the bottom of the connector, there is a wide space. That is the ground tab.  going counter clockwise at about the 5 O'clock position that pin is not connected, about 3 o'clock is the mic in, at 1 o'clock is key out 2, at the top or 12 o'clock is the ground, 11 o'clock is key out 1, 9 o'clock is the key in (the push to talk on the microphone) , the 7 o'clock is not connected and the center pn is not connected.

You do not have to use the special locking connector,but can use a DIN connector that is common on lots of equipment in the US.  The DIN connector is much easier to find.

What's the power level of the RF in/out port? If it's 3 watts, you should use a power attenuator.

Jack

The adapter for a p1225 is readily available via eBay for few dollars, search for p1225 connector, same as gp68 , unscrew antenna, screw in adapter.
Is your 8924 only rated for 3w? If so use an attenuator.
A 20db attenuator rated at 100w will allow you to test up to 100w.
There is a setting to adjust by the 20db so numbers read out properly if you go that route.

Mic pinout is available in manual IIRC, look in files section.

Good luck

Mark

Yup I found the connector. I also ordered a metric boatload of adapters and BNC patch and breakout cables (why can't radios standardize already? There are even multiple versions of RP-SMA...).

I got the 60 watt version which will most likely be sufficient for most of my experiments. I'll look into getting an attenuator if I ever start playing with larger radios.

Watched the video and skimmed the 8920 manual. It will be arriving later this week, so that's when I'll be able to actually dig in.

I used a ceramic mic element that's available on eBay. It's sold as a replacement for a D104 microphone and works perfectly on my 8920.

Providing the attenuator can handle the power, a 10db attenuator would bring your 60 watt 8920 to 600 watts. If you have a need to measure 100 watts, You could probably find a 10db, 100w attenuator which would allow 100 watt continuous power measurements. There's a setting in the configure menu that will compensate for the attenuator. I use a 20 db attenuator on my 3 watt 8920 and measuring 100 watts, I don't have to worry about over heating the attenuator or damaging the unit. Keep in mind that the 8920 internal attenuator isn't rated at continuous duty. You can easily damage it with a long term, 60 watt power level. If your only testing hand helds,
there's no worry.

It will beep at me if it's getting too toasty right?

So I'll look for an attenuator and a Return Loss Bridge. I'll ask the local swap net.

Also, I see there are 3 different pins labeled "Key" something on the mic connector. Which one is a PTT? Or is there? How exactly does the transmission feature work? It appears I can use this as an SSB transmitter right?

You may want to look for a Mini-Circuits ZFDC-20-5.  This makes a good return loss bridge to tune duplexers.  While not as accurate as some of the more costly units when you pass about 25 or so db of return loss, it will work fine unless you are doing exect measurments of very low return loss.

If you over heat the input it will let you know.  I think you said you had a 60 watt uint. It should take 100 watts for about 10 seconds out of every minuit without damage.

One of the key pins on the 8924 is where you key the mic to turn on the transmitter section of the 8924.  The others are where the 8924c turns on the transmitter under test.

I think the 8924 uses DSB instead of SSB to transmit with.

It will beep at me if it's getting too toasty right?

So I'll look for an attenuator and a Return Loss Bridge. I'll ask the local swap net.

Also, I see there are 3 different pins labeled "Key" something on the mic connector. Which one is a PTT? Or is there? How exactly does the transmission feature work? It appears I can use this as an SSB transmitter right?

# 1302. Tracking Generator vs RF Tools Swept Return Loss

Yahoo group: hp8924
Date: 2013-01-24 05:09:43 UTC
From: Nicholas
Topic: 1302  Message: 1302

So basically, do I need to purchase the RF Tools SRAM card?

The so called "Tracking Generator" appears to be built in to the 8924C and will allow me to tune antennas and duplexers (especially with this magical Return Loss Bridge that I'm looking for). Correct?

The RF Tools card has a program called Swept Return Loss. Is this different from the Tracking Generator? Do I need/want it?

No, you do not need the RF Tools card/program.  If you have a memory card, you can down load the program off the internet.  The memory card just holds a program that is written in a language similar to the old computer BASIC language with commands especially for the test set,  You can do everything manually the card will do.

Actually, you can not use the program to tune a duplexer.  The return loss program on the card is just a one shot sweep and not a real time program, if that makes sense.  In other words, after you have a system tuned up, or mainly looking at an antenna system, you run the RF tools return loss program and get a snap shot of the system.  If you do not like what you see, you would have to turn a screw on the duplexer some and run the program again.  Not a good way to tune anything and it would take a week or a year to tune a duplexer.

To tune a duplexer, all you need is a return loss bridge, dummy load and the 8924C.  The bridge is just a simple SWR bridge. The dummy load does need to be a good one that is 50 ohms.  All you are doing is tuning the duplexer for minimum SWR.  SWR and return loss are really the same thing, just stated in differant units.  The bridge does allow you to tune th duplexer using very low power so you do not creat arcing inside the cans.  You can also see a broad range of frequencies so you can tell if there is anything odd going on as you tune the duplexer.

I found this a while back and the Minicircuit bridge is plenty good enough to tune a duplexer.  It is less than $ 100 instead of around $ 300 for some of the others.  I bought 2 off ebay a while back and use one and gave the other to another local ham.

Using the 8924 with a Mini-Circuits ZFDC-20-5 to measure return loss.

The first thing to do is to configure the 8924 for "duplex out" and "antenna in"and set up the tracking generator for no offset. To measure return loss hook the "duplex out" on the generator to the "out" connection of the directional coupler. Then hook the "antenna in" port to "couple" of the directional coupler. You can now establish the base line on the spectrum analyzer as this will show infinite SWR or minimum return loss. It should read about 20 db less than what you are generating. Once you've done this connect the load or device under test to the "in" port of the coupler. The space under the base line on the spectrum analyzer is the return loss in negative db. (Note: this may be counter intuitive to some but we're using the directional coupler to measure what's coming back as apposed to what's going out which is what the labels on it are for.)

Hi,
While I agree that using the spectrum analyser and tracking generator built into the 8924C with an RLB is the best way of ADJUSTING a diplexer or filter,  RF Tools is better  for MEASURING them. The RF Tools software allows the normalisation (calibration) of the RLB over the frequency range of interest. This allows for accurate measurements without factoring in (or even knowing) the losses and coupling factor of the RLB. This means that a homemade RLB is just as usable as a commercial one. A "hybrid" (transformer based) power divider/coupler can be used as a RLB with slightly reduced performance but lower cost. A 4 way splitter will give better isolation, just terminate the two unused ports with 50R loads.
The HP RF Tools also give other functionality such as a monitoring receiver.
Declaration of interest, I sell RF Tools on a PROM card on ebay. I offer the same card for list members at a discounted price.

Robert G8RPI.

# 1307. 8924C Power Supply

Yahoo group: hp8924
Date: 2013-01-25 07:17:25 UTC
From: Glenn Little WB4UIV
Topic: 1307  Message: 1307

Has anyone located a schematic for the power supply in the 8924C?
I just got bought a 8924C that is in need of some work.
Before I reinvent the wheel by reverse engineering the supply, I
thought that I would ask here.
Is there a list of capacitors for the supply?
When I repair my supply, if there is no capacitor list, I will generate one.
If there is no schematic, when I get time, I will rectify that situation.
The supply in question is part number 0950-2952.
This is marked with HP name on the case and on the board.
It might have been a contract design and build.

Thanks
73
Glenn

Hi Ross,
I can do you a PROM card with RF Tools (11807E) for $60 including shipping. This is the same as my ebay item No. 261146747019 If you are interested please pay by PayPal to this email address or ask and I'll send you a payment request.

Regards,
Robert Atkinson G8RPI.

Subject: [hp8924] WTB RF Tools on a pcmcia card

I've owned a 8924c with an Eagle RLB for years now and very happy with the machine. All I hear are good things about rf tools and with the new roll cart for the beast I want to check some old cable runs. I've seen many cards offered months back but was lacking petty cash back then. Accepting any reasonable offers. Thanks

Regards,
Ross kc7rjk

Hi,
If you look at the circuit for a 2 way transformer hybrid divider and a transformer style RLB you will see they are identical.  To use a two port divider as an RLB you connect the unknown to the common port and the RF source and detector to the divided port. A 4 way is 3 2 ways with the outs of No1 connected to the commons of 2 & 3 this gives added isolation. connect the unknown to the common, the RF source to output 1, the detector to output 2 and terminate the two unused ports with 50R loads. Note the loads don't have to be higjh quality, a small dummy load is OK. Yes the splitter impedance determines the reference impedance. You could dissasemble a cheap CATV splitter and change the 75R resistors to 50R if you wanted to.

See

From: jyelmgren
Topic: 1307  Message: 1310

There is some information in the files area.
Typically what fails in the supply is the 15VDC "standby" supply due to a cap failure on the associated riser board.
The failure is easy to determine since you will not have the green LED that can be seen through the bottom rear corner of the power supply.

The 15VDC supply schematic is pretty straight forward and usually the PWM IC data sheet is all that is needed.

Main problem is that there are about two thousand screws ( OK maybe it's only 1,000 ) to get to the failed components.

If the failure is more involved there was a good amount of used tested supplies on Ebay ..have not looked recently.

# 1313. error 0040 on startup

Yahoo group: hp8924
Date: 2013-02-10 12:46:14 UTC
From: andersg.stenberg
Topic: 1313  Message: 1313

I have a HP8921A with error 0040 on startup
Looks to be something with the timer or real time clock
When I check the LEDs will flash diode 2 and 3. Since LED lights 1 steady and then LED 1 and 2 on solid. Then all the lights for a while and then go out.
A8 memory card is upgraded with extended memory.
Is it A8 card that is faulty or ...
Does anyone have such a card.
Thanks in advance / Goran

# 1314. Looking to purchase...

Ive been looking to purchase a service monitor and like most cant afford a $15,000-50,000 peice of bench equipment. So ive been looking at this 8924c, a IFR 1200s and a Motorola R2100D. I mainly do work on amateur radio and some commercial equipment, as well as the occasional CB, FRS etc radio. I read somewhere that the 8924 may be my best bet for the money and as i dont have much to spend i was also wondering if maybe for what my needs are, this may be over kill? I do like the idea of being able to connect a external monitor to it though im more concerned about functionality and use for my needs that being able to make my eyes happy lol.

Thanks for any help in making a decission and any information/input anyone may have. Sorry if this is semi off subject too, though ive been leaning twoards this HP, also whats a fair price for the 8924C?

Thanks agian,
David

Topic: 1314  Message: 1316

Hi David,
The only real downside to the 8024C is it's size. But that's not too much of an issue for bench work as any collection of separate RF gen, 2x AF gen, power meter, modulation meter, receiver, spectrum analyser and tracking genarator you could buy for the same price would be much bigger :-). I can't comment on the Motorola, but I've used the IFR 1200S (and other of their units) and it's not in the same league. It's predominatly an analogue unit apart from the counter and RF gen. Unless you need the portability I would not consider it. If you do need portability, hold out for a 8920A/B. Another option, depending on local availability and price is the Marconi 2955.

Robert G8RPI.

I have a 8924c and have used the  1200 in the past.  The 8924c is way beter than the 1200 if you do not need to carry the 8924c out to a job.  The 8924c weighs in at 60 pounds. There is another HP called a 8920 B that does what the 8924c will do if you get all the options for it and it is only about 40 pounds.  Only problem is the 8924c about $ 1600 or less and the 8920b is about 3 to 5 thousand.  I bought a 8924c off ebay for about $ 850 shipped and spent another $ 150 to buy an input attuenuator option to take it from 3 watts input to 60 watts input. It will handle 100 watts input for about 10 seconds with that option.
I am just a ham and only use the 8924c for a hobby so price was my main issue.  Even if it wasn't I would still get one if I did not carry it to the field.

The 8924c manual leaves out much, but there are free downloads for the 8920 manual.  There is some differances in the buttons and the layout, but if you understand that it will get you on the right track. Because the 8924c does so much , plan on spending about 2 weeks getting to know about it.  Also look on utube for some vidios of an E8285. That set is very similar to the 8924c.

Here is a place that has some for sell that includes a new CRT display and calibration for about $ 1600.  Also lots of information about them.
http://www.amtronix.com/usequip1.htm
While there, look around the site as there is some good information on the unit.

I have not delt with that place, but have heard nothing but good about it.

I bought a tool cart from Sears to place my 8924c on.  It has 5 draws an rolls around.  I think I got it on sell for just over $ 100.

If you are a ham and want to talk about it on the air, we can set up a sched and I will talk with you about it or help you get it going .

One other question that we need to ask you is have you ever used any service monitors ?

Wow, first off, thank you all for the fast and detailed replys, It looks like i have some thinking to do and saving (money) as well lol. I would like something a tad smaller hense the reason i was looking at the 1200s, but i suppose if the HP does more and is a better unit i could find a way to make room for it.

I used to be a ham back in the early 90's, then i kind of fell out of radio for a number of years. Im hoping to hit the VEC this week actually to take the test again.. Anyhow, yes i have used a service monintor before, but we're talking some old stuff CE-3 and CE-5's, looks as if i may be waiting a tad longer to purchase now as im about 500 shy of 1600 and recently unemployed. I was at a ham fest yesterday and found a CE-6 for $200 but its old, hasnt been calibrated in 20 years and didnt have all the preselectors i would need so i passed on it. Anyway maybe in the coming weeks i'll have my new call and i'll see if we cant meet up on IRLP or something of the like :)

Im off to go apply for jobs for the day, thanks again to all who replied, i have considerably more information now and have some thinking and researching to do now :)

Thanks again!
David

Yeah Pete, ive been reading for hours now it seems lol, i think im with you on this decission. Im not really planning on doing alot of portable work so i can acomodate the size and as stated before, saves space in the sense you dont have a bench full of equipment which was one of the reasons i was going this route. I have limited space, but all in all, i think this unit will do all i need to. Just need to sell off some more stuff so i can get the remaining money needed for it lol.

I tried looking around and im finding pleanty of these units uncalibrated with used crt's and are about the same if not more than what Amtronix wants for a calibrated refurbished unit and offers a warranty. All that is worth it to me to save up the extra money, i just hate being so damn impatient lol.

Good luck to you on finding a job.

There is no way to compair the newer service monitors to the old CE-3 type.  The newer ones are more computer than anything else.  Nomatter what you get in the modern line, be prepaired to spend a lot of time to learn how to use it. It is like getting out of your car and stepping into a modern jet airplane cockpit.

I worked as an instrument technician and had over 20 years learning to test and setup instruments used in industry,so learning the 8924c was not too bad, but still took a while of just playing with it.  I did repair some CB radios back in the 70's to pick up some extra money and learn how to work with RF equipment.  Probably repaired an average of 5 per week in my spair time at home as I had a regular job.  I did that for several years with not much more than a frequency counter, old heathkit signal generator, and Heathkit VTVM. The circuits were simple back then.  Then the price of new ones dropped out the bottom and it was cheaper to buy a new one than to get it repaired.

I retired about a year ago and now I play with the ham radio. I have been licensed for about 40 years and did pick up a FCC first class license when I was 22 years old,but never worked where I needed it.  I have been keeping up a couple of ham repeaters for about 30 years.  Mostly with outdated equipment or borowed equipment.  Found out about the 8924C, so bought one. I got it off ebay and have less than $ 1000 in it.  As it is not used for comercial work, I did not care about it having a certified calibration.  It is still probably beter calibrated than most service monitors.  I can tune in WWV and the counter shows it to be right on 20 mhz to the last Hz most of the time.  Can not say it made the repeaters work any beter, but I now know they are right and have good numbers to go by instead of just saying the repeater seems to hear as well as another rig I was compairing it to.
It is a pain to drag the 8924c to the repeater, but atleast it is in a small building on the ground and I can park less than 50 feet away from it.

If you do get an 8924c, be sure to look over a lot of the older messages here for some helpful hints.  You can down load some of the manuals here also.  As I said, the 8924C manual is almost useless unless you are servicing old cell phones, but the 8920 manual tells a lot more about how they work.  It is just some of the buttons are labled diffeantly and in differant places.  What you see on the screen will be almost the same.  Look on that Amtronix web page for a quick start guide also.

If you are looking for a 10M to 1 G spectrum analyzer, take a look at the 8922 series units. These are available for considerably less (250 to 1K) than any of the other test sets, but they are real boat anchors at around 75 pounds. And you have to make sure you get opt 006 so you get the spec analyzer function. The 8922 was intended as a cell test box that was loaded with that sort of functionality, but no so much RF test capability. I bought one when the last of my 141Ts gave up and used it for the spec analyzer function until I was able to find a nice 8920A, which I think is about the ultimate when it comes to ham radio testing. Down side is the 8920A is very pricey and the plug in card with RF Tools is hard to find and expensive.

Keep hoping that someone will come up with some hacks on the 8922 to make it do more. Mine is now on an old TEK scope cart and I use it to make sure my 902 repeater is still working.

You cannot go wrong with an 89XX series monitor. I bought an 8920B at a very good price and have not looked back, The sheer numbers of these instruments on the market ensures parts availability for a while and the level of documentation and knowledge base (specifically this group) is terrific.

I doubt you will find sufficient repair parts, documentation, or knowledge base to economically own an IFR, a Motorola or any other vendors monitor . In fact I am not aware that any documentation or spares exist for the R2100D monitor, nor the succession of Motorola/General Dynamics products which followed.

I say this without bias because I used a R2100D for years and it was a fine, easy to use instrument. The HP89XX monitors are just a better designed more flexible instrument, although there is a bit of a learning curve in using one. Hint: Presets are your friend.

From: Dave Trainor
Topic: 1314  Message: 1323

I can't add much technically that others have not said here, but I recently bought a 8924c from Rick at Amtronix and am very happy with it, for my usage I wanted to be able to use the spectrum analyzer down in the lower HF range and Rick was 100% right that it works perfectly down to 400KHz, the calibration is off, and he has a chart available, but the unit does all I wanted and knowing that they professionally checked and calibrated the unit was worth it to me.

73, Dave N8ZFM

Subject: Re: [hp8924] Looking to purchase...

I have a 8924c and have used the 1200 in the past. The 8924c is way beter than the 1200 if you do not need to carry the 8924c out to a job. The 8924c weighs in at 60 pounds. There is another HP called a 8920 B that does what the 8924c will do if you get all the options for it and it is only about 40 pounds. Only problem is the 8924c about $ 1600 or less and the 8920b is about 3 to 5 thousand. I bought a 8924c off ebay for about $ 850 shipped and spent another $ 150 to buy an input attuenuator option to take it from 3 watts input to 60 watts input. It will handle 100 watts input for about 10 seconds with that option.
I am just a ham and only use the 8924c for a hobby so price was my main issue. Even if it wasn't I would still get one if I did not carry it to the field.

The 8924c manual leaves out much, but there are free downloads for the 8920 manual. There is some differances in the buttons and the layout, but if you understand that it will get you on the right track. Because the 8924c does so much , plan on spending about 2 weeks getting to know about it. Also look on utube for some vidios of an E8285. That set is very similar to the 8924c.

Here is a place that has some for sell that includes a new CRT display and calibration for about $ 1600. Also lots of information about them.
http://www.amtronix.com/usequip1.htm
While there, look around the site as there is some good information on the unit.

I have not delt with that place, but have heard nothing but good about it.

I bought a tool cart from Sears to place my 8924c on. It has 5 draws an rolls around. I think I got it on sell for just over $ 100.

If you are a ham and want to talk about it on the air, we can set up a sched and I will talk with you about it or help you get it going .

One other question that we need to ask you is have you ever used any service monitors ?

Ive been looking to purchase a service monitor and like most cant afford a $15,000-50,000 peice of bench equipment. So ive been looking at this 8924c, a IFR 1200s and a Motorola R2100D. I mainly do work on amateur radio and some commercial equipment, as well as the occasional CB, FRS etc radio. I read somewhere that the 8924 may be my best bet for the money and as i dont have much to spend i was also wondering if maybe for what my needs are, this may be over kill? I do like the idea of being able to connect a external monitor to it though im more concerned about functionality and use for my needs that being able to make my eyes happy lol.

Thanks for any help in making a decission and any information/input anyone may have. Sorry if this is semi off subject too, though ive been leaning twoards this HP, also whats a fair price for the 8924C?

Thanks agian,
David

I know this may be sacrilegious but has anyone looked at the new Rigol SA? It got a great review in QST recently for ham radio applications and lots easier to use. I've also seen some teardowns on Youtube that show it to be a well designed and constructed SA for $1500 with a TG.

Hi David, I hope you find gainful employment soon. With all these 89XX numbers flying around I thought some information on models would be useful for you.
8920A Portable RF test set for analog radios. Spectrum analyser is an option, make sure it's included. "B" model is improved processor, more RAM and standard memory card.
8921A Basically an 8920 with signalling options to use with analog cell phone systems.
8922A through S GSM digital cellphone test set. Big box. Very little analog functionalty. Only useful as a 10MHz to 1000MHz spectrum analyser and tracking generator IF OPTION 006 or 106 is fitted,or CW signal generator. Can be very cheap surplus but the $40,000 new price means some sellers have inflated ideas of value.
8923A DECT cordless phone test. Big box Basically only good for parts.
8924C Basically a 8920B with spectrum analyser and CDMA (early digital) cellphone options in a big box. Best bang for your buck. Covers 10MHz to 1000MHz with full accuracy AM, FM and SSB testing. Works down to 400kHz with reduced level accuracy (this is due to the value of the coupling/DC blocking capacitors in the electronic attenuator). Low cost software give accurate filter/diplexer/cable measurements and scanning radio receiver.

The comments on reading the 8920A/B manual are correct, the 8924C is a super-set of the 8920, so will do everthing. The 8924C manual is very cell phone biased. See the Amtronix website on how to set it so it boots in analog mode.

HTH,
Robert G8RPI.

Yeah Pete, ive been reading for hours now it seems lol, i think im with you on this decission. Im not really planning on doing alot of portable work so i can acomodate the size and as stated before, saves space in the sense you dont have a bench full of equipment which was one of the reasons i was going this route. I have limited space, but all in all, i think this unit will do all i need to. Just need to sell off some more stuff so i can get the remaining money needed for it lol.

I tried looking around and im finding pleanty of these units uncalibrated with used crt's and are about the same if not more than what Amtronix wants for a calibrated refurbished unit and offers a warranty. All that is worth it to me to save up the extra money, i just hate being so damn impatient lol.

Hi Jerry,
If you primarily want a spectrum analyser they may be worth a look. If you want a service monitor with an SA option they are not much use.

Great rundown on the differant types.  One other comment is to make sure it is a 8924 with a "C" on the end.  There is an E version out that seems to leave out the analog stuff that is what most need now.  I am not sure if there are any  A or B versions out of the 8924 series.

That is another good thing about the 89xx series, the ability to program in some often used tests.  Say you want to test a lot of receivers for sinad on 150mhz.  Just set up the 8924c one time and save the tests.  The next time you want to do the same test, just hit the reall button and select the test.

There are some predefined tests in the files section here that can be put on a memory card and loaded into the 8924c and 8920 series.

Depends on what you are trying to do.

If it is bench work than the 8924C would be the better more cost effective solution.
The 8924C does automatically tune to the TX signal which you really want for doing alignments.

The R2600 is lighter but the tracking gen is optional and no autotune on the versions I had.

Would look at the Amtronix 8924C differences page and compare to the R2600 capabilities.

Would take a 3Watt version and add an external attenuator to cover highpower.

Yahoo group: hp8924
Date: 2013-02-11 19:53:56 UTC
From: Robert Atkinson
Topic: 1327  Message: 1332

Hi Pete,
I've never used the R2600 series but had a quick look at the spec for the latest D version. Pluses over the 8924C are calibrated coverage down to 400kHz, colour display and lighter weight. Downsides  are the SA will has a maximum span of 10MHz per div or 100MHz across the screen, the tracking generator is optional and it is much more expensive, $6000 for a B or C without the TG. If I could get a 2675D for the price of a 8924C I'd take it, but that isn't going to happen. If I was buying for a business I'd tend to the 2675D because it's a lot younger and supported. For personal use the 8924C is very fixable by the hobbyist.
Oh by the way, the 8924C will also transmit across the whole range, just plug a mic into the front panel.

Robert G8RPI.

One thing that people are forgetting is the venerable E6380...

http://www.amtronix.com/e6380a.htm

I bought one of them from Amtronix, with a bridge, and I'm very happy
with it.

Its certainly lug-able, more so than an 8924c , it also has RF tools
built in.

See here for comparison between models...

http://www.amtronix.com/diff.htm

regards

Tim

I also purchased a 8924C from Rick at Amtronix and have been very happy with it as well as the time Rick spent with me on the phone discussing my options. I wouldn't hesitate buying from him again.

Would you happen to have his contact information? I may not be able to come up with the money needed for one from Rick, im close, but still nearly 600 off lol. Got some things in the works, so hopefully i can order one soon, if not this sounds like its a good and cheaper route. I assume your's was in good physical condition? Im not looking for new in the box, but also dont want anything that looks like it was ran over or rolled down a hill lol.

This groups great, cant wait to get one of these so i can start playing/learning lol.

Thanks!
David

# 1338. Re: Looking to purchase...

Yahoo group: hp8924
Date: 2013-02-13 17:02:54 UTC
From: Al Wolfe
Topic: 1314  Message: 1338

I bought a refurbished 8924c from Rick of Amtronix at Dayton last year for $1250. This was the 60 watt load unit with new CRT. He was advertising them on the web for $1400. So, if you are going to Dayton you may want to wait a bit before having one shipped.

# 1339. 11807 NA FM UG problem

Yahoo group: hp8924
Date: 2013-02-15 02:23:43 UTC
From: Jim Kossow
Topic: 1339  Message: 1339

Group I just got a 11807 card I plugged it in and started running all the programs to see hot is all works. I have a problem when I try and run the NA FM UG program I get an error;

After about 2 minutes the screen displays the following message;

ERROR 18 IN 1356 String ovfl. Or Substring err

What is this and how do I fix it?

TNX Jim

# 1340. Re: [hp8924] 11807 NA FM UG problem

Yahoo group: hp8924

From: Ralph Mowery
Topic: 1339  Message: 1340

That seems to be a probelm with the 8924C.  Here is what someone posted.  I edited the file for my 8924c and it seems to work.  You can use wordpad to edit it.
The part at the bottom of the message is where he ran the program on a transceiver and the results.
The program is written in HP Instrument Basic or something like that.  It looks similar to the old Basic language with commands particular to the instruments.

Also the files can be downloaded from the files section here.

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++

Hi

Here is how i got it to work,and i am working of emulated drives >

A. Make these changes***for Ts_rev$[3])>=08 use the first # of your firmware mines A.08.04***

```
1134 IF Ts_mod$="HP 8924C" OR (VAL(Ts_rev$[3])>=08 AND Cur$="YES") THEN
1397 IF Ts_mod$="HP 8924C" OR VAL(Ts_rev$[3])>=08 THEN
14002 IF Ts_mod$="HP 8924C" OR VAL(Ts_rev$[3])>=08 THEN
```

```
1334 ! IF POS(FNTs_mod$,"8921")<>0 THEN
1335 ! IF POS(I_o$,"TACS")<>0 THEN
1336 ! Flt_1$="CCITT"
1337 ! ELSE
1338 Flt_1$="C MESSAGE"
1339 ! END IF
1340 Flt_2$="6KHZ BPF"
1341 Cur$="YES"
1342 SUBEXIT
1343 ! END IF
1344 IF POS(FNTs_mod$,"8924C")<>0 THEN
```

```
13640 IF FNTs_mod$="HP 8924C" THEN
```

```
13651 IF FNTs_mod$="HP 8924C" THEN
```

```
14027 ! To_ts("*RST")
```

```
14017 ! To_ts("*RST")
```

B. Use the POWERON register

C. Set squelch control on in customize test procedure: Set up frequencies and any othe parameters you need

D. turn on Data collection if you want to get a file (i will upload the manual

E. Run the program

good luck

IC-28H low power no audio on mic line or any paramaters set

-Date [MM/DD/YY] 010413  Time [HH.MM) 21.43

This program performs automated tests for  FM radios.

Could this be a firmware issue?

Mine is A.08.02

How do I upgrade if I need too?

TNX Jim

Subject: [SPAM]Re: [hp8924] 11807 NA FM UG problem

That seems to be a probelm with the 8924C. Here is what someone posted. I edited the file for my 8924c and it seems to work. You can use wordpad to edit it.

The part at the bottom of the message is where he ran the program on a transceiver and the results.

The program is written in HP Instrument Basic or something like that. It looks similar to the old Basic language with commands particular to the instruments.

Also the files can be downloaded from the files section here.

Group I just got a 11807 card I plugged it in and started running all the programs to see hot is all works. I have a problem when I try and run the NA FM UG program I get an error;

After about 2 minutes the screen displays the following message;

ERROR 18 IN 1356 String ovfl. Or Substring err

What is this and how do I fix it?

TNX Jim

I don't know that much about the program, but it seems that it was written for the 8920 instead of the 8924C.  To make the program work , in several lines you have to replace the 8920 to 8924C.  Then there is a small hardwear differance in the 8920 and 8924C that needs to be taken care of.

I don't know what kind of memory card you have or if your computer will write to a memory card or not.  If you can get a memory card you can read and write to, and a 256K card is big enough, you can go to the files section here and down load the programs and then edit the lines to make it work on the 8924c.  You transfer the needed files just like you would to any removiable disk or thumb drive.

There is an image of the program in the files section, but it is harder to work with.

I do not think the version of the softwear in your 8924c is going to keep the program from running.  I don't recall what version mine is other it starts with an 8.

The details of the fix are in post http://groups.yahoo.com/group/hp8924/message/1277
The program is really looking at the different model names (8920a,8921a and 8920b ) in it's original form.
It also looks at firmware levels to set the program values up correctly .

I actually changed the fix slightly to work with 5.x 8924C but never really had time to test it.

My take is that the NA_FM program in question is more for manufacturing final test than field use.

The are some interesting utilities in the RF Tools program but never really had much use for it. The cable fault was about the most useful thing I saw in there but if someone has found other good use cases I would be interested.

I agree with you.  None of the programs are that useful to most people.  The cable fault is the only thing that I know of that may be of some use that can not be easily set up manually, and probably just as quick if not quicker.  Also you can use the storage already in the 8924c to save some of the more frequent setups.

The NA FM part is mainly for testing a lot of radios that are the same, such as production or if a fleet is doing a big swap out.  It is interisting to see the program do its thing on a radio.

I bought the 8924c after I retired because I wanted a decent test set for my personal use. I got the rf tools by a download to a pcmcia card I had, so do not have that much in it. It is interisting to play with when you have some time on your hands on a rainy day.

Like you, if someone has found a good use for the programs in a non production application other than the coax fault, I would like to hear about it.

I find the swept scan and return loss most useful. They have slow sweeps so are not great for adjustments, but with the calibration function it gives you accurate measurements at minimal cost. Basically a poor mans digital scalar network analyser with compensation for unknown or homemade bridges / couplers. The standard tracking generatior is good for adjusting.
The scanner function is also useful but it must be the biggest VHF/UHF scanner ever. It does cover all frequencies including those missing from handheld units in some countries ;-)

"You do not have to use the special locking connector,but can use a DIN connector that is common on lots of equipment in the US. The DIN connector is much easier to find."

Marlin P. Jones Assoc. (www.mpja.com) sells the locking connector, the exact mate to the 89xx series. I bought two of them and they fit and lock correctly. The price is two dollars and change and, last time I looked, he had about 90 of them in stock (he doesn't always restock when he runs out). I bought one for a mic. I've yet to find and one for accessory wiring as needed.
Tom

>
> I can't get it copy the drawing of the connector so I can send it to you, but the 8920 is very close to the 8924c. If you do not know it, look for a manual of the 8920 as that tells more about how to use the set for non cell phone testing.  You will have to watch what the buttons are called as some are labled differantly and are in differant places on the two sets.
>
> If you download the 8920 manual 108920-90221.pdf which is probably in the files section here or you should be able to get it from the Agilent web site, look on page 580 for the picture of the connector.
>
> If you start at the bottom of the connector, there is a wide space. That is the ground tab.  going counter clockwise at about the 5 O'clock position that pin is not connected, about 3 o'clock is the mic in, at 1 o'clock is key out 2, at the top or 12 o'clock is the ground, 11 o'clock is key out 1, 9 o'clock is the key in (the push to talk on the microphone) , the 7 o'clock is not connected and the center pn is not connected.

Yes i would have to agree, i beleive i got the best bang for my money. And i sure dont have 30-50,000 USD to spend on something newer lol. I think this will last me many years to come and i felt more comfortable dealing with Rick than eBay or any other places. Im sure theres some good places out there, but i dont think anyone offers a deal as good as his.

Im sure i'll spend many days/nights playing with it and learning how to use it as its WAY more advanced than a CE-3 lol. Though all the basics should be the same, just need to learn to navigate the menus and such im sure. Hope you enjoy yours as well, i wish i could have afforded the 8920b for its size and weight, but ill make the extra room for it and i also dont intend on moving it much once its setup lol.

Now i get to save up to replace my scope i sold years back (mainly cause i never learned to use it much lol) and see if i can find a nice DSO with at least 2 channels and in the 150-200mhz range.

David

Hi David,
There is a DSO in the 8924C. Only 50kHz bandwidth though!
I'm sure you will be pleased with the 8924C it a great bit of kit. Rember that they cost around $40,000 not that long ago.

Robert G8RPI

Subject: [hp8924] Re: Looking to purchase...

Yes i would have to agree, i beleive i got the best bang for my money. And i sure dont have 30-50,000 USD to spend on something newer lol. I think this will last me many years to come and i felt more comfortable dealing with Rick than eBay or any other places. Im sure theres some good places out there, but i dont think anyone offers a deal as good as his.

Im sure i'll spend many days/nights playing with it and learning how to use it as its WAY more advanced than a CE-3 lol. Though all the basics should be the same, just need to learn to navigate the menus and such im sure. Hope you enjoy yours as well, i wish i could have afforded the 8920b for its size and weight, but ill make the extra room for it and i also dont intend on moving it much once its setup lol.

Now i get to save up to replace my scope i sold years back (mainly cause i never learned to use it much lol) and see if i can find a nice DSO with at least 2 channels and in the 150-200mhz range.

David

From: Keith
Topic: 1271  Message: 1353

I've tried to use the image you uploaded with the hpdrive emulator. It returns an error that the file isn't a 9122 image. The file size should be 614k. Did this file work for you and if so how did you get it mounted with the hpdrive program. I can't access it with my 8920A. I can mount a new image and read and write to it but it's 614k in size not 640k.

Hey Robert,

Yeah, you are correct, it was a high end costly unit not long ago, i guess its just the CRT that ages it for me lol. If it was a color CRT that would be different, but that mono green is god awful. I hated it in the 80's and 90's, dont care much for it now either lol. That aside, im happy i purchased it. It should show up sometime today, and my christmas can commence :D Looks like im going to get to have some fun today and need to order some stuff like type N adapters and such. Wish i had a local source for a GBS8200 lol.

Have a great day!
David

Thank you all for your comments, went ahead and purchased the HP8924C 100 watt unit from Amtronix.

Pete..

Hello all,

I have sent my money today to Rick@Amtronix for the HP8924C, also purchased the Return Loss Bridge and the opt 100 software card. So now I wait for it to arrive and have some fun!

Pete..

Hey Robert,

Yeah, you are correct, it was a high end costly unit not long ago, i guess its just the CRT that ages it for me lol. If it was a color CRT that would be different, but that mono green is god awful. I hated it in the 80's and 90's, dont care much for it now either lol. That aside, im happy i purchased it. It should show up sometime today, and my christmas can commence :D Looks like im going to get to have some fun today and need to order some stuff like type N adapters and such. Wish i had a local source for a GBS8200 lol.

Have a great day!
David

> Yes i would have to agree, i beleive i got the best bang for my money. And i sure dont have 30-50,000 USD to spend on something newer lol. I think this will last me many years to come and i felt more comfortable dealing with Rick than eBay or any other places. Im sure theres some good places out there, but i dont think anyone offers a deal as good as his.

>
> Im sure i'll spend many days/nights playing with it and learning how to use it as its WAY more advanced than a CE-3 lol. Though all the basics should be the same, just need to learn to navigate the menus and such im sure. Hope you enjoy yours as well, i wish i could have afforded the 8920b for its size and weight, but ill make the extra room for it and i also dont intend on moving it much once its setup lol.
>
> Now i get to save up to replace my scope i sold years back (mainly cause i never learned to use it much lol) and see if i can find a nice DSO with at least 2 channels and in the 150-200mhz range.

OMG this box was huge lol.. I guess in my mind even though i read the specs it hought it wasnt going to be quite so deep/long? LOL now i see why people have a seperate cart for this beast :) Received well packaged and its up and running as we speak. Now i get to figure out how to do all the stuff ive read and watched, yay! lol

I want to thank everyone here again for their help in making this decission, again my only wish would be for it to be smaller, but i'm happy!

Pete, you had to go and out do me by buying the extras huh? lol, i figured id buy a RLB or build one, same with rftools, one more thing to add to my list of projects.

David

From: Ralph Mowery
Topic: 1314  Message: 1358

That thing is sort of large and heavy.  The first thing I did was go to Sears and found a roll around tool box that was on sell for slightly over $ 100.  It has 4 or 5 draws to put stuff in such as test cables, adapters, and some other rest equipment.

You can save a lot on the RLB by going to this one.
Mini-Circuits ZFDC-20-5

Not lab grade, but plenty good enough for service work.  I found two on ebay for about $ 80 for the two of them shipped.  Gave one to a local ham to use with his e8285 that is similar to the 8924c.

The RF Tools can be downloaded from the files section.  Another on here I think is in England may still have some cards he loads with RF Tools for about what you can often find a blank card for.  He was selling them on ebay,but giving a discount for the ones over here if you contact him direct.

There is not too much on the RF Tools that is that good except maybe the coax fault distance test..

Also is a test called NA_FM that is not too useful unless you are setting up and testing a lot of transceivers that are all the same.  The one in the files section will need to be modified to work on the 8924c as it appears to be made for the 8920.

OMG this box was huge lol.. I guess in my mind even though i read the specs it hought it wasnt going to be quite so deep/long? LOL now i see why people have a seperate cart for this beast :) Received well packaged and its up and running as we speak.  Now i get to figure out how to do all the stuff ive read and watched, yay! lol

I want to thank everyone here again for their help in making this decission, again my only wish would be for it to be smaller, but i'm happy!

Pete, you had to go and out do me by buying the extras huh? lol, i figured id buy a RLB or build one, same with rftools, one more thing to add to my list of projects.

# 1359. Where To Purchase

Yahoo group: hp8924
Date: 2013-02-22 15:04:40 UTC
From: kc7wsu
Topic: 1359  Message: 1359

I called Amtronix to purchase a HP 8924c and they said that they were all sold out.

Are there any other good places to buy them? I want one calibrated and that already has the 100W upgrade done.

Regards,

Chris Andrist, KC7WSU

There are some on e-bay right now. I got one from testequip714 last week and it works perfectly and calibration is right on for all functions.

Topic: 1314  Message: 1361

I may hold off on the RLB for now as i wont have tons of use for it just yet though id still like to have it. And the price was right on the RF Tools from the group member here, so it would be nice to have if i need it.

Im going to head to the stores this weekend to see what i can come up with for a stand/cart for it. Currently it fits on my table/bench with some room to spare but i like the cart idea. Been checking craigslist as well for them hoping i could find one cheap or free (i love that price).

If this guy locally still has this ZFDC-20-5 i may buy it but i think he already sold it cause hes not responding to my inquiries. But he only wanted $20, thanks for the info on this RLB!

Hope everyone has a great weekend, thanks Ralph for the help and information :)

# 1362. GBS 8200 Sync Seperator Question.

Yahoo group: hp8924
Date: 2013-02-22 17:16:14 UTC
From: nolimit3o3
Topic: 1362  Message: 1362

Ok ive seen a few different methods, all are cheap and easily built, my question is this, is the LM1881 the better option as far as ease of setup goes? I read its basicly build/plug and play, no adjusting sync pulses etc? This and exactly how the BNC from the 8924c is connected to it are basicly the only questions i have. I almost certain about the connections to the GBS but wanted the best/easiest solution for the sync seperator. This will be my next project once i sell off some more stuff and clear some space. Still need to buy the GBS8200 lol.

Anyway, if this LM1881 is the best option, ill go ahead and order it so i can build the board when i get the GBS here eventually. I as usual am trying to do too many things at once outside of just this stuff, im too good at that. Need to quit starting so many projects or getting involved in them at least lol.

# 1363. TX Power Measurement

Yahoo group: hp8924
Date: 2013-02-23 18:01:22 UTC
From: jsternmd@att.net
Topic: 1363  Message: 1363

I get about an 8% difference in Power measurement going from "Peak" to "Sample". With the 8924C TX Power Measurement set for "Sample" I get exactly 1.00 mW but in "Peak" it drops to 0.92 mW.

I zero in between measurements. The HF signal source is 1.00 mW 50Mhz from a calibrated HP8660C in pure CW no modulation. No different whether I use RF in or Ant. I am also verifying/setting the source with a calibrated HP 438A.

Is this due to component aging going through different signal paths?

Is there a different calibration procedure for Peak or Sample?

thanks
jerry

From: Ralph Mowery
Topic: 1363  Message: 1364

On my 8924c when I go from Peak to Sample there is an offset of about .18 unless I remove the input  power and hit the 'zero' button every time I switch from Peak to Sample.

When I zero every time I switch, there is no differance in what the 8924c shows.
That is with a signal with no modulation on it.

I found the problem as Ralph pointed out. I was re-zeroing before I made the switch from Peak to Sample. I would measure - zero- then switch. Now 100% same reading when I do it in the right sequence. Who knew it would be so sensitive.

Thanks
Jerry

From: Ralph Mowery
Topic: 1363  Message: 1367

I Zero on Sample and set for 1.00 mw.  Then switch to Peak and get .82.  If I then remove the coax and zero on Peak I then get 1.00 again.  If I switch to Sample it is 1.18 before I remove the coax and re-zero the 8924c.
I checked this at 50 and again at 170 MHz and the results seem to be the same.

# 1368. HP 8922M (NOT 8924C!) Tracking Generator?

Yahoo group: hp8924
Date: 2013-02-24 00:42:14 UTC
From: Gary Sanders
Topic: 1368  Message: 1368

I've been a member of this group for a little while, but never posted before. (I was sort of waiting to see if my particular issue ever came up :).

I'm the (not so) proud owner of a 8922M (NOT 8924, unfortunately) with the Spectrum Analyzer Option, and I've seen postings here that say the 8922 with spectrum analyzer has a tracking generator. I've also seen postings that it doesn't.

One posting provided fairly detailed (from memory) steps to set it up. Well, darned if I can find anything that looks like a tracking generator, and the steps that were mentioned don't seem to match anything I can find on my unit. I can find the RF generator OK, but darned if I can figure out a way to make it track ANYTHING!

Can anyone say definitively whether or not the 8922M with Spectrum Analyzer provides a tracking generator?

And if so, would you mind posting the steps needed to enable and operate it?

Thanks in advance for any advice (other then dumping the 8922 and getting a 8924 - it's not in the budget right now!) anyone can provide.

Gary Sanders

On the spectrum analizer screen on the bottom left you should see a portion that says Controls.  Highlite this and you should see choices of Main, RF Generator, Marker, and Auxilarry.  The RF Generator is the screen that controls the tracking generator. This should be about the same as the 8924C, but not exectally.

# 1370. Re: [hp8924] HP 8922M (NOT 8924C!) Tracking Generator?

Yahoo group: hp8924
Date: 2013-02-24 04:21:50 UTC
From: Gary Sanders
Topic: 1368  Message: 1370

Thanks for the quick response, Ralph.

Yes, I can find and select the RF Generator option itself, but I don't see any options within that selection to enable Tracking.

The only menu items pertaining to the RF Generator I have are the RF Output Frequency and Level, and I can select which BNC connector to route the signal to.

When I route the RF Generator Output to the Spectrum Analyzer Input with a BNC cable, I can see an RF carrier at the selected frequency and level. When I change the RF Generator Frequency, the carrier moves on the Analyzer screen. I see no option to allow the carrier to Track the analyzer sweep.

What am I doing wrong?

Gary Sanders

From: Robert Atkinson
Topic: 1368  Message: 1371

Hi Gary,
I've used the 8924x before but don't have one to check at the moment. However as far as I can recall and check from the 8922M operating manual, the 8922 does not support tracking generator operation. The RF gen selections are Frequncy (non-hop) or Hopped, with no track option.
There is also the issue that the Span is only 4MHz (10MHz over-range).
The SA module is the same part as the 8920 & 8924 so it's not a hardware problem. I've seen mention that you can write an ibasic program to drive the hardware directly and overcome these limits, but it's beyond me. If you have a PC with an HP-IB interface it might be worth trying the 892o RF Tool swept measurement software as a starting point. The last 8922 I had was rough  (it came with a lot of other kit) and I actually broke it for parts. I got more for the SA module than I've ever got or paid for a complete 8922x!
Unfortunatly the 8922 is only good as a narrow span digital SA, 50kHz DSO, CW RF generator and medium perfomance frequency standard in a very big box.

Sorry to be the bearer of bad news,
Robert G8RPI.

Thanks for the info Robert.

That was my take also, but based on some previous posts I was hoping someone had discovered some hidden menu selections or something.

I'll look into the ibasic route and see if there's a workaround there.

Thanks,

Gary Sanders W0BY

I realize it's bad form to reply to one's own post, but here goes:

I took a look at the 8922M programming guide, and I don't see any direct references to a tracking generator.

I suppose I could simply repetitively increment the CW generator frequency within the range of interest, but I don't see any way to sync it to the internal sweep generator for the Spectrum Analyzer, so I'd have to experiment.

I don't currently have a GPIB adapter, so off I went to eBay to get a feel for cost. I wish I hadn't. The bottom of the barrel yielded a couple in the $120 to $150 range (including one for $140 "For Parts"). Most are in the 300 to 500 dollar range.

So, I looked up RF Tools - another 300 bucks. That brings the total up to the neighborhood of $500, just to see if the idea would work.

That's roughly half the cost of simply chucking the 8922M and replacing it with a 8924 that already would do what I want.

One thought - you mentioned that the Spectrum Analyzer option is the same in the 8920/22/24. If I removed the Option from my 8922M, would it simply be a matter of dropping the Option into a 8924 that was originally built without it, or does firmware have to be changed to enable it? (Basically, I'm looking for a method that would get me into a 8924 with minimal additional investment. Did I happen to mention that I'm cheap?)

The spectrum analyzer module for the 8920 and 8924 are the same, the
module for the 8922 has a part number that indicates that it is for the 8922.
The may be minor differences, I do not know as there is no known
schematics for the 8922.
Nor is there a known block diagram for the 8922.

In what little spare time that I have, i am trying to generate a net
list for the 8922 mother board.
From this a block diagram could be generated.

The 8922 comes in a number of versions.
It is possible that another version has the tracking generator function.

A18 Spectrum Analyzer 8922 08922-61045
A18 Spectrum Analyzer (Opt 002 or Opt 102) 8920A/B 08920-61852
A32 Spectrum Analyzer (Opt 002 or Opt 102) 8924C/E 08920-61852

I have generated an Excel spread sheet that shows the modules for the
8920, 8922 and 8924.
I did this in an attempt to find the interchangeable modules.
I have noticed that some of the 8922 modules have a part number
indicating 8922, bur a board number indicating 8920.
I would guess that there are some part differences between the
boards, but, the boards are basically the same.
I have not checked the board number for the 8922 spectrum analyzer.

Hope that this helps and does not add to the confusion

I purchased an HP- 8924c DOA. After replacing the power supply and running the unit I noticed the message "reference unlocked, check reference connection and frequency" at the top of the screen. I entered setup (shift setup) and it shows I am set for a external reference. I don't know where to make the chance to switch to the internal reference oscillator.

Any help would be appreciated

There should be a jumper on the back of it that loops the internal
reference into the 8924c.

# 1379. Re: [hp8924] HP 8922M (NOT 8924C!) Tracking Generator?

Yahoo group: hp8924
Date: 2013-02-25 12:24:25 UTC
From: Robert Atkinson
Topic: 1368 Message: 1379

Hi Glenn,
Interesting, It was a few years ago that I scrapped the unit so maybe my memory is failing on the part number. Or perhaps I had an odd unit. The SA module certainly sold for a good price without complaint though.
To answer some of Gary's questions, It's not worth keeping the SA module to fit to an 8924C as it was standard fit on this unit. You can get the RF Tools code from the group files section. On GPIB look for an older ISA card (HP or NI, NOT TransEra) and stick it in an older PC.

From: Robert Atkinson
Topic: 1375  Message: 1380

Hi Lee,
A bigger question is what drivers does it come with and what software is supported by it.
If it is a simple USB-Serial-GPIB unit it may be of little use unless you write your own code for it.
I've not spent time tracking down exactly what it does.

# 1382. Another advantage of RF Tools - Lower frequency work.

Yahoo group: hp8924
Date: 2013-02-25 17:59:32 UTC
From: Robert Atkinson
Topic: 1382  Message: 1382

Hi, Following an off-list question I looked at using RF Tools for low frequency (HF) applications. We all know that the 8924C is only specified down to 30MHz because of the DC blocking capacitors in the electronic attenuator. It's pretty accurate down to 10MHz and tunes down to 400kHz. The question was would RF Tools correct for the attenuator error. Doing a swept loss measurement using the SA/TG from 2.5MHz to 7.5MHz showed a drop off of 9.5dB at the LF end. Doing the same using RF tools swept insertion loss gave a flat response across the whole range. This is good news for anyone wanting to do HF band work. Obviously there is no "free lunch", there must be a compromise. I this case we are losing some dynamic range, but gaining an accurate result.

Robert G8RPI

# 1383. Re: HP 8922M (NOT 8924C!) Tracking Generator?

Yahoo group: hp8924

From: c_day_nz
Topic: 1368  Message: 1383

Every 8922 I have seen has limited RF gen tracking functionality.
I have purchased 2x 8922 SA modules and they work fine in E8285A - they error (but work) in 8924C. When comparing 8924C & 8922 SA module PCBs, 8924C has aditional BW circuitry which is probably the error I was getting. A cheap solution may be 8924E and fit your 8922M SA module to it. The 8924E was almost the same as 8924C but did not come standard with SA - its slower which I'm picking is mainly a firmware thing. There is 8924C firmware in the group so it may be possible to upgrade 8924E firmware to make it the same as 8924C - not sure though. 73s Chris ZL1CVD

From: Ralph Mowery
Topic: 1385  Message: 1386

Unzip the RF Tools to a directory on your hard drive.  The file extensions will not look familiar to most people.  You then get one of the memory cards (I think it is a PCMCIA without looking up exectally what that card is called)  that fits in the 8924c or similar and transfer the files to that card.  I just use the windows explorer program to drag and drop them to the memory card.

There is also an iso image in the files section, but it is much harder to work with.

Then you put the memory card in the 8924c and you can run that program from that card on the 8924c.  It will take about 2 to 3 minuits for it to load,

 There is a fellow selling the program already on a card on ebay for about what most of the cards cost if you have to buy one.  He is often on this group and may sell you one direct for less than ebay.  I think I have seen them sell from others for over $ 200, but his is less than  $ 100.

You can take Microsoft Word and open most of the files to look at them.  They look similar to the old BASIC programming.  I think it is about the same, except there are some commands that are specific to the HP machines.  I think they call it IBASIC for Instrument Basic.  They can be changed and modified if you know what you are doing.  Someone did that so the FM-NA would run under the 8924c instead of the 8920.  I modified the file by his instructions and it worked fine on my 8924c where before it would give an error.

Hi Ralph,
The card is a PCMCIA type. For the simple method you describe it needs to be a battery backed up SRAM card.  Note that using a CF or SD card in a
PCMCIA adaptor will not work as these use the ATA "disk drive"
interface, rather than the direct address mode needed by the 8924C. This method will not work with all PC's as many do not have the required drivers for these older cards. Format the card in the 8924C before putting it in the PC.
I can supply PROM cards with RF Tools on them, see ebay item 261165684352. I offer these directly to list members at a discount, contact me off-list if interested.

Regards,
Robert G8RPI.

Robert,

Do you know of sources for the 40 pin “Epson” card as used in the 8920A? I have sometimes noticed offerings of the HP card on ebay for $500 or more, and occasionally see the bare card for around $200 with no guarantee of the condition. Not sure the original RF Tools is worth that much, but think it would nice to have at the $100 level.

Suppose I should go for an HPIB interface and buy the second source RF Tools, but hard to justify.

Probably should think about getting an 8924C, but I have the old big iron 8922M and the 8920A, so would have to find some more room.

Have used Cushman, Marconi and IFR test sets and really prefer the 8920A.

Hi Jim,

I am a new group member. I have a late-production 8935/E6380A, and an 8921A. I purchased the 11807A Opt. 100 card from Amtronix for around $150. A few days ago there were 3 of these cards on eBay at $58 each, but they were Rev. B.01.01 and mine is Rev. B.02.01 so I did not buy one.

You can sometimes find blank 40-pin Epson cards on eBay at prices ranging from $100 to $200, but as you say there is no guarantee as to their condition. Yet another source could be the older voting machines as used in some US elections. These machines stored results on a 40-pin Epson card.

I have found RF Tools very useful for such measurements as swept return loss, swept gain, swept insertion loss etc. Here is an example:

http://www.ab4oj.com/atu/presel/main.html

I wonder if it would be possible to replace the Epson card socket in the instrument with a PCMCIA socket.

Subject: Re: [hp8924] R F Tool program

Robert,

Do you know of sources for the 40 pin “Epson” card as used in the 8920A? I have sometimes noticed offerings of the HP card on ebay for $500 or more, and occasionally see the bare card for around $200 with no guarantee of the condition. Not sure the original RF Tools is worth that much, but think it would nice to have at the $100 level.

Suppose I should go for an HPIB interface and buy the second source RF Tools, but hard to justify.

Probably should think about getting an 8924C, but I have the old big iron 8922M and the 8920A, so would have to find some more room.

Have used Cushman, Marconi and IFR test sets and really prefer the 8920A.

Topic: 1385  Message: 1390

Hi,
I have a few ideas for solutions to this. In order of dificulty,
1/ Use HPDrive to download the program via HPIB. This needs a PC with GPIB card.
2/ Use a plug-in EPSON to PCMCIA adaptor. This is not as hard as it sounds. The EPSON card has 50 thou edge contacts. A section of a PCI card edge connector fits. You can buy PCI extenders with ribbon cable from China on ebay for a few $. I've a memory card from a 8922A and have confirmed that the connection works. I've not wired it up to a PCMCIA socket as I've no 8920A to test it in.
3/ Wire a PCMCIA socket in parallel with the existing EPSON connector and have an internal card (or replace the EPSON socket) Both this and  2/ will need unused PCMCIA address lines pulled low and function lines set for linear addressing. Chip Enable could go via a switch so the existing socket could be used.
4/ Options 2/ & 3/ could use an EPROM programmed with the BIN image instead of a PCMCIA card.
5/ Put an EPROM with the BIN image in a spare memory socket and re-wire the address decoding so it appears in the memory space for the EPSON card.

Subject: RE: [hp8924] R F Tool program

Hi Jim,

I am a new group member. I have a late-production 8935/E6380A, and an 8921A. I purchased the 11807A Opt. 100 card from Amtronix for around $150.  A few days ago there were 3 of these cards on eBay at $58 each, but they were Rev. B.01.01 and mine is Rev. B.02.01 so I did not buy one.

You can sometimes find blank 40-pin Epson cards on eBay at prices ranging from $100 to $200, but as you say there is no guarantee as to their condition.  Yet another source could be the older voting machines as used in some US elections. These machines stored results on a 40-pin Epson card.

I have found RF Tools very useful for such  measurements as swept return loss, swept gain, swept insertion loss etc. Here is an example:

http://www.ab4oj.com/atu/presel/main.html

I wonder if it would be possible to replace the Epson card socket in the instrument with a PCMCIA socket.

Hi Jim,
If You have a PC with an HPIB I/F you don't need to buy RF Tools. The files are in the group files section. You use the shareware HPDrive program to emulate an external HPIB disk drive. Once loaded the program remains in NV RAM in the 892X.

Subject: Re: [hp8924] R F Tool program

Hi
Ralph,
The card is a PCMCIA type. For the simple method you describe it needs to be a battery backed up SRAM card.  Note that using a CF or SD card in a PCMCIA adaptor will not work as these use the ATA "disk drive" interface, rather than the direct address mode needed by the 8924C. This method will not work with all PC's as many do not have the required drivers for these older cards. Format the card in the 8924C before putting it in the PC.
I can supply

PROM cards with RF Tools on them, see ebay item 261165684352. I offer these directly to list members at a discount, contact me off-list if interested.

Subject: Re: [hp8924] R F Tool
program

Unzip the RF Tools to a directory on your hard drive. The file extensions will not look familiar to most people. You then get one of the memory cards (I think it is a PCMCIA without looking up exectally what that card is called) that fits in the 8924c or similar and transfer the files to that card. I just use the windows explorer program to drag and drop them to the memory card.

There is also an iso image in the files section, but it is much harder to work with.

Then you put the memory card in the 8924c and you can run that program from that card on the 8924c. It will take about 2 to 3 minuits for it to load,

There is a fellow selling the program already on a card on ebay for about what most of the cards cost if you have to buy one. He is often on this group and may sell you one direct for less than ebay. I think I have seen them sell from others for over $ 200, but his is less than $ 100.
Do you
You can take Microsoft Word and open most of the files to look at them. They look similar to the old BASIC programming. I think it is about the same, except there are some commands that are specific to the HP machines. I think they call it IBASIC for Instrument Basic. They can be changed and modified if you know what you are doing. Someone did that so the FM-NA would run under the 8924c instead of the 8920. I modified the file by his instructions and it worked fine on my 8924c where before it would give an error.

Hi,
No, as far as I know it needs to be an internal card due to timing and identification issues. The original external drives used features specific to the controller chip. See http://www.hp9845.net/9845/projects/hpdrive/

From: kernkampj
Topic: 1397  Message: 1397

I was looking for how to deal with SRAM cards on my computer, and found this -

1. Insert the PCMCIA SRAM card into the PC Card slot of the computer system.
2. When the 'Hardware Wizard' appears, select 'Install from a list or specific location (advanced)'.
3. Click 'Next'.
4. Select 'Don't search I will choose the driver to install'.
5. Click 'Next'.
6. Scroll through the list of choice and select 'PCMCIA and Flash memory devices'.
7. Click 'Next'.
8. Double click 'generic' under the manufacturer listing.
9. Select 'Generic PCMCIA Memory Card' from the model listing.
10. Click 'Next'.
11. Click the 'Yes' button when the warning dialog appears, to dismiss the warning.
12. Click 'Finish' when the 'Completing the found new hardware wizard' dialog appears.

In case that doesn't work, I have also uploaded an XP driver for SRAM cards that I found on the web. I haven't tried it, though, so no guarantees.

Hi Joe,
It depends on the Flash card. If it is a linear flash, you should be OK. To transfer the Binary Image you can use the MCE (Memory Card Explorer) program and a PC (laptop) with a PCMCIA slot. The 8924C can't write to Flash cards. Again depending on the exact Flash card you have, you may need a laptop with 12V programming capability, This is not that common on modern laptops. CF or SD cards in PCMCIA adaptors won't work.
There must be a fault with your SRAM card. The coin cell should last at least a year.

I found a couple of cards that have an internal rechargable battery.  I think the card says it will hold the memory 2 or 3 months if left unplugged.  It will recharge in the device they are plugged into.

They work fine just by dragging and dropping the files off the windows 98 laptop I use for this and programming some old things.

It is very easy to print the screen of the 8924c to a computer. I don't know how to record it as vidio.

Go to the files section and download "bts_sw.zip".

You will need a 'speical cable' that plugs into the back of the 8924c and goes to the rs232 input of a computer. I don't know the name of the plug, but it looks like the modular telephone plug and the eithernet plug. It has 6 connections on it if I remember correctly.

There is documentation on which pins connect from this plug to the rs232 plug. I have made one and use it with a netbook computer and have an external rs232 to usb adapter to get into the netbook. I don't know what the origional cord was for, but where I worked I asked the computer shop if they had anything like that and they gave me a cord that had a plug on each end, so I cut it in half and put the rs232 connector on one end.

When you have the softwear loaded, you can save the file to the computer and I think if you have the 8924c set up correctly, you can just hit one of the buttons on the 8924c, but it has been a long time ago that I seem to remember doing it that way.

I used this and it works. Little cumbersome but good. I also used it with HP digital scope.

I bought a commercial converter to use with VGA and found an older 13 inch monitor that works great.

Bigger screen comes in handy when tuning cavaties as I can turn the monitor around so I can see it from step ladder needed to tune 6 meter cavaties that are 1 foot in diameter and 80 inches tall.

Looks like you have all the info on screen serial capture with the BTS software. For video capture, look for a 19.2kHz capable USB / PCI video capture card. I personally don't know can't recommend any but someone must make them. 73s Chris ZL1CVD

I just use my JVC HD cam for video screen capture. It took some time to figure out the right camera to use, but it works fine now.

Hi Jim,

I had the same problem. BTS will not install on Win7. I had to purchase PrintCapture and pull the image off my 8935 and 8921A via the GPIB port. You can download a 30-day free trial.

I'll second that....

PrintCapture is highly capable software and if you have other
instruments, i have an HP 54720A and a HP 8566B, it works with them too.

No relation to manufacturer, just a happy customer :)

regards

Tim

Having no luck with BTSUtils and Win 7;

I have created a Puppy Linux live boot CD that runs the BTS utilities under wine. The ISO file is here:http://vvgmc.org/freda/radio-puppy.iso feel free to donwload and use it. It's 326.7 MB.

Windows users, if you don't have a program that will burn ISO files to CD/DVD try isoburn: http://isoburn.org/ (no interest, just a happy user)

below is a photo of it running on a 700 MHz Pentiuum III machine with 384 MB of ram. It does not need a working hard drive. ( that's my vintage 2000 laptop with a dead hard drive in it. The BTSUtil program runs on it, now I just have to get a USB serial port to work with wine.)

just boot the cd and click on the BTSUtil icon on the desktop, then set up the com port(s) you want to use.

Note: I don't yet have it working with USB serial dongles.

Hi Chris,
I'm no Linux guru, but I suspect a big advantage is it's not an install or dual boot. If you don't screen dump often you don't need an extra PC. Just put this CD in your drive, re-boot and capture your screen shots. Then just take the disk out and re-boot into whatever MS bloatware your PC normally runs on.

Robert got it dead on. If you have a system that you don't or can't modify, this OS will boot and not touch the hard drive, In fact, it doesn't even need a hard drive to run - hence, it's usefulness on my old laptop with a dead hd.

It will also run on OLD machines, Pentium III and up to the latest and greatest CPU.

If you only have one machine with Windows 7 and don't want to install another OS, just boot from this CD (or even flash/pen/jump drive) when you're done, just reboot back to your original OS

Silva,
Jim, ki6njf, here. I'm the author of the puppy linux with the BTSUtil software additon. How may I help you?

This software is very easy to use. Download it from:
http://vvgmc.org/freda/radio-puppy.iso

burn it to a cd with software that understands ISO file types such as isoburn:
http://isoburn.org/

reboot the computer connected to you HP test set and click on the BTSUtil icon on the desktop. Then just run the BTSUtil as if it were on a windows system. You can copy the BMP file that you saved from BTSUtil to a flash/pen drive and walk it over to your main system or copy it over your local area network.

Hello--

Likewise-- strangely, the "kernel panic" left my test
PC in an odd mode. Its "power off" switch was inoperative
(I pulled the AC power cord to shut down the system),
and the keyboard's "scroll lock" and "caps lock" LEDs
were blinking and nonresponsive to their key switches.

I burned the CD with IsoBurner for Windows on a PC
running Windows XP, so my hunch is that there's nothing
wrong with Silva's procedure.

Hope this helps, and 73--

Hello Brad,
greetings from Brazil!!!
The same happens here...
I had to pulled the AC power cord to shut down the system too...
I will burn a new CD under Windows XP to test again. But I believe sothing is wrong with the CD image file!

Best 73's,

Silva.

I do apologize, there was a problem with the file size. It was too small.

I've re-uploaded it, and then check the md5 sum of the download file with the original. they match now.

Hello, Jim--

That dawg won't hunt<g> [1]. I burned a CD using the new iso image and
the same set of problems occurred (please see my earlier message).

The boot routine displayed...

Performing a "switch root" to layered file system-
[107.408414] Kernel Panic-- not syncing, attempted to kill init

(Followed by four more messages) The PC locked up, with keyboard
lights blinking.

Hope this helps, and 73--

Brad AA1IP

*******
Explanatory note:

[1]Meaning:

That dog won't hunt is a US phrase meaning something won't fulfil its
intended purpose, or a plan or scheme will fail.

Origin: It is southern US slang, originally that old dog won't hunt
meaning something just isn't going to happen.

http://english.stackexchange.com/questions/52755/meaning-and-origin-of-that-dog-dont-hunt

Brad, I cannot get it to fail from a linux system, next locate a windows system and use iosburn to generate the bootable cd to see if that is an issue.

The locking up of the keyboard and blinking lights is the standard response to a kernel panic.

Silva, could you check the md5 sum of the file on your Ubuntu system?

Use the command md5sum radio-puppy.iso from the directory that the iso file is in. It should reply: d93f69e26c370566713c0b7e5898f92b radio-puppy.iso

Hello Jim,
I has downloaded the once more and I get the correct md5sum at this time:
d93f69e26c370566713c0b7e5898f92b radio-puppy.iso
I will burn it and try again.

Best regards,

Silva.

# 1426. Re: Video Capture

Yahoo group: hp8924
Date: 2013-03-07 19:28:21 UTC
From: kc7wsu
Topic: 1401  Message: 1426

So, I think I found a solution.

I just ordered an MVC007 off ebay to output to VGA, because I wanted the VGA output anyways. I also ordered an Epiphan VGA2USB adapter. http://www.amazon.com/Epiphan-Systems-VGA2USB-External-Capture/dp/B000UO94DU/ref=sr_1_1?ie=UTF8&qid=1362684357&sr=8-1&keywords=epiphan

So the MVC007 will give me VGA and the VGA2USB will capture the VGA to my PC.

I will post back once I get both to let everybody know. I really hope this works.

Regards,

Chris Andrist, KC7WSU

From: Ralph Mowery
Topic: 1427  Message: 1428

Could you explain a little about what is too wide ?

If it is the sinad meter part of the 8924c moving around too much, that can be made smoother and slower by putting in a larger number for the averaging.

I don't have my 8924 handy right now to tell the exect thing to do, but mainly you highlight the sinad  part of the screen and hit the AVG button.  You may have to hit the function button so you get the ave instead of something else.  Then you put in  alarger number such as 20.

Then you have to make the adjustments slower.

The notch appears to be too wide. Like - 400hz wide (+-200). It seems that it once worked close to the Sinadder readings and I may have set something somewhere.....

There was a service bulletin explaining an accuracy discrepancy with the built in Sinadder. Indeed the filtering is to blame. I do not recall a fix or work around.

The notch filter is on the Audio Analyzer 2 Board (A2). I have uploaded a schematic of the filter in case someone has the time to look into modifying it to work correctly.

I wonder if this applies to the 8920A/B as well. Does anybody know? If not, it would be interesting to compare the circuits to determine the difference and whether that would lead to a mod.

# 1434. Sinad Tests

Yahoo group: hp8924
Date: 2013-03-11 16:09:13 UTC
From: kernkampj
Topic: 1427  Message: 1434

I did some comparison tests with the 8924C and my Motorola R2001C.

Here are the results -

SINAD
Signal Source - HP HP Mot
-118 dBm - 12.5 12.7
-115 dBm - 19.1 19.4

SINAD
Signal Source - Mot HP Mot
-118 dBm - 13.3 13.7
-115 dBm - 19.3 19.7

There does appear to be a small difference in the SINAD determination of the two instruments, but I'm not sure if the difference is worth worrying about.

It also appears that there is a slight difference in the RF output levels between the two instruments. I'll have to look into that.

There does seem to be a small ammount of differance, but not enough to worry about.

If you look at the specs of the instruments, you will see they are probably  within tollorance.

I worked for a company where part of the job was calibrating instruments.  Our test equipment in the shop was sent out every year to a calibration center that could be traced to government standards.  We used a computer test data base that would not let an instrument pass if it was more than .5% off at any of 5 test points in the range.

While the readout in the instruments in the process were to two or sometimes 3 decimal places, the actjual value could be off a lot.  One example was temperature.  At 300 deg C. we could read it to 3 decimal places , but it could actually be off 2 or 3 deg.

Too many people make a big deal over nothing when it comes to what the instruments show. You just use the same instrument and hope it stays off by the same ammount from day to day.

As they say, a man with one clock knowes what time it is, but a man with two clocks is never really sure.

I have an old signal generator like they show in the old GE Mastr ll manuals.  It compairs close enough to my 8924c for me. Not perfect, but close enough.

If your 8920 has the fixed-frequency notch filter, and not the variable-frequency option, the circuit is the same.

I tried to find the bulletin I mentioned. I downloaded a bunch of stuff from Agilent when it was still available, now have so much, I could not find it.

The bulletin compared the 892X with another Agilent product. If I recall it was a larger discrepancy than you noted. It would be interesting to see how an analog Helper Industries SINADDER or the standalone Motorola automatic SINADDER reads out. Realistically, getting an accurate SINAD value is always a challenge. When I used to do this every day, my ears were as repeatable and "accurate" as the meter. No kidding.

Here is one bulletin that describs some ways the sinad can be differfant.  From a quick read it seems that the notch filter and how the audio is processed can make a db or two of differance.

For the most part, in the field it is not going to make any real differance.  Just use the same  test set and tune for the best.

This may be it.
http://wireless.agilent.com/rfcomms/refdocs/gsmgprs/meas_sinad_desc.html

Here is the inportant part.

Difference in Agilent 8960 Series 10 and 8920B Test Set SINAD Measurements
If you have previously used the Agilent 8920B RF Communications Test Set to measure SINAD, you may notice that the Agilent 8960 Series 10 test set's SINAD value may be higher by up to 0.8 dB when measuring 12 dB SINAD. This is due to the more precise digital notch filter used by the Agilent 8960, allowing a more accurate noise measurement to be made. The Agilent 8920B uses an analog filter that does not have as precise a filter notch as the Agilent 8960.

# 1441. HP 8924E Attenuator error

Yahoo group: hp8924
Date: 2013-03-12 22:54:25 UTC
From: Silva
Topic: 1441  Message: 1441

Hi all,
today I was working on a equipemnt and my HP 8924E was reading the power about 3dBm when suddenly it reads about -28dBm. Then I has checked the power with another service monitor and I was noticed the power is the same as before 3dBm. Back to HP 8924E again and I gaet just -28dBm.
I think it is some attenuator the culprit.
Any ideas to solve this issue?

Thanks in advance and Best regards,

Silva.

Topic: 1427  Message: 1442

Well, I have compared the 2. We have NIST traceability. Our lab has a Helper Sinadder 101. It's old. It's amazing! Infinite on the left end of the scale. 0 (zero) on the right. Put a 1khz in it and the meter doesn't move. Run the volume up and down - meter doesn't move until you get clipping from the audio amp itself. Change the freq to 995 or 1005 hz - meter moves to 30db. 3 more hz change - 20db. Each 1hz step is clearly visible on the meter. I have zero beat with a 10mhz signal from the NIST interface and WWV at 10 mhz using an HF receiver SSB mode set 1 khz below freq and the meter lays at the peg except for the ticks and then goes crazy during the time announcement.The later Sinadders have wider notches like about anything else. We also have a Sinadder 3. it's a wider notch too. A different Sinad meter standard was set ( I think) in 1982. The calibration check says in the manual to be certain your 1khz tone is within 5hz, 5hz!

How do the Helper and HP differ when performing a Sinad test? Not much at all! Does it really matter if your 2m fm rig has .21 or .23 uV sensitivity?

As for SNR and distortion - I have seen only a few cases where there was much difference. The Helper once led me to a 900hz leak through a faulty diode.

I asked the question to see if anyone knew of a setting I had overlooked to change the width of the notch. I did not intend to imply that we were using faulty equipment and set off a panic.

When following the procedure making a test with the Sinad function the results are accurate to 1 db. I tested it last week on 2 different Bendix-King units and they read just as they did using dedicated stand-alone devices.

I have a procedure I do several times a day that involves zero -beating 2 1khz tones. It takes a few seconds on the Helper. The 8924 shows it's good when 100 hz off.
But then, it wasn't designed for this test. I was just trying to use the 8924 to eliminate a few pieces of equipment on Test Bench 1 so I could set up a Test Bench 3 with minimum investment. Looks like the Helper Sinadder will stay on Bench 1.

I have played with the 8924 extensively for the last 2 weeks. I have learned about 10% of it!

For it's intended use - the 8924 is perfect. All in one box. Bench 1 has a 1ghz scope, function generator, a 1ghz rf generator, a 2.5ghz freq counter, a distortion analyzer, a 10 ghz spectrum analyzer, a 10 ghz power meter (all HP), a Boonton micro wattmeter, a Boonton millivolt meter, Lampkin Deviation meter. At a cost of nearly $100K. Each has far more versatility than that section of the 8924. Is the finished product going to be any better? No.
I am going to get one for myself!

I have the schematic of the Helper unit if anyone wants to look at the circuit to suggest some changes to notch filter width in the 8924. I'll gladly change a few components.....

I have what I guess is an origional Helper Sinader.  The one with the sloping case.

I hooked it up the my 8924c and looped the audio of the 8924c in and out and set it up for sinad.  It does not take much off frequency from the nominal 1000 hz for it to really show up on the Helper, but it takes a lot, like 100 hz or 150 hz off before the 8924c sinad meter moves very much.

Like you said, probably not any real differance in a receiver, but not up to doing your special test.

There is not much the 8924c won't do.  It does take a while to learn it and the book is not much if you do not do the old cell phones.  You have to get the 8920 book and learn the differance in the buttons to really get a lot out of the books.

Outside of weighing 60 pounds it is about the best unit for the money.  Especially if you can find one with a 60 or 100 watt input.

Yes. On the rare occasion when I was required to perform the test (Helper Sinadder) I, too, found that the result was usually a confirmation of my "aural" measurement. Also true with the 20db method.

1) What mode of operation are you measuring? CW, SSB, TDMA etc.
2) What mode is the test set in? Spec analyser? Peak, Average?

3) Could you have a bad connector on front panel of the 8924?

4) Have you tried the self test on the 8924E to loop back a known signal?

# 1449. AM and SSB Tests

Yahoo group: hp8924
Date: 2013-03-15 17:33:35 UTC
From: Garret
Topic: 1449  Message: 1449

I am considering the purchase of an 8924C, but I need it to perform AM and SSB measurements. I cannot seem to find reference to this in the data sheets or manual. Everything I see is for FM and CDMA measurements. Could be I'm looking in the wrong documents.

Would someone please confirm for me that this instrument, in standard configruation (no options) is capable and calibrated for AM and SSB measurements? Is it capable of everything the 8920B is capable of?

Thanks,
Garret

Hi Garret,

According to the HP 8924C Reference Guide, the instrument supports AM and SSB. You can download the Reference Guide on the Agilent website.

The Agilent 8935 E6380A is an alternative at a somewhat higher price.

# 1452. Re: AM and SSB Tests

Yahoo group: hp8924
Date: 2013-03-15 20:09:22 UTC
From: Garret
Topic: 1449  Message: 1452

Thanks Robert, Adam and David. That's what I needed to know.

Now another question: I understand the standard version will work below 30MHz, but it's not calibrated, and that readings error is significant below 10MHz. In practical use, how much does that impact testing when working with HF radios in the 1-30MHz band?

Thanks,
Garret

From: Ralph Mowery
Topic: 1449  Message: 1453

The 8924c has all the functions that you need to check out analog systems.  Probably most everything is standard that is options in the 8920b sets.  Becareful and do not get the E version as it leaves out alot.

It will work fine for checking out AM and SSB sets.  Just look in the 8920b manuals for the setups and tests.  Some buttons are differant,but it is mostly the same.  I do think that it generates and demodulates ssb as actually a dsb signal.  I do not recall anything for usb and lsb eventhough it shows up as ssb.

Below about 10 mhz the calibration for the power is off.  That is the signal generator and also the wattmeter.  Depending on he version of the 8924c,  you  may be able to only put in 3 watts, 60 watts , or 100 watts.  They will over range for short periods of time.  I am thinking either 5 or 10 watts for the 3 watt version, 100 watts for the 60 watt version for about 10 seconds.  There is a warning if things heat up too much.

You can go here and see some of the screen shots of the 8924c.

http://www.amtronix.com/hp8924c60.htm

At the bottom is some links for more information and a chart of how a typical unit falls off in power caliberation.

Unless you need to know the absolute sensitivity or power output of a rig below 10 mhz or so it will not make that much differance in servicing rigs.  You can go by the chart on the Amtronix site and get close enough.  You can also get another signal generator and watt meter and make your own calibration charts.

All other functions such as frequency, modulation percentage/deviation and others will still be accurate.

While a 3db transmitter power differance will be noticable on a wattmeter, I doubt that a 3db differance on receive below 10 mhz will be noticable on any good receiver due to the ambinant noise from the antenna.

As this set is a do all unit be prepaired to spend several weeks or more learning what all it will do.  It is easy to use once you know how it works.
Also if you are running the same tests over and over, you can store the setups in the memory and just hit a button or two to recall the test you want to do.

# 1455. 8922M opt 010 without 83220E.

Yahoo group: hp8924
Date: 2013-03-19 23:22:27 UTC
From: msauve2
Topic: 1455  Message: 1455

Just putting this out there for future reference.

Picked up one of these for cheap ($150, shipped), with spectrum analyzer and 10811 OCXO. The warning (83220 not connected) is easily bypassed, but the label and warning about using the RF In/Out connector was scary.

I took off the front panel to fix some keys which weren't working well, and took the chance to look around. Mine apparently had the 010 option installed post-factory.

On the 8922M (no opt 010), the RF I/O connector is a BNC, and runs to the A24 8 dB attenuator, then to the A23 Input Section. These connections are all SMA hardlines (RG-405, probably). What they did when converting it to opt 010 was to simply cut the hardlines to/from the attenuator (it's still there), and run new from a front panel SMA straight into the Input Section (and install new firmware).

The docs say the 83220 provides 7 dB attenuation as it passes signals into the (previously) RF I/O input. That's close to the 8 dB attenuator, so the new firmware or calibration makes up for the difference. Running the same signal into both the RF I/O input and the Aux RF In showed that the 8922 thought it was ~7 dB higher when measured on the RF I/O input.

Anyway, with the attenuator, the non-010 M would handle up to 41 dBm (12.5 W/50 ohm) into that jack. The docs say 15 W continuous, 100 W for 10 seconds. That 8 db attenuator is pretty hefty, with heat sink fins on it. With the 010, you need the 83220 to provide an input with that high a level, otherwise you're limited to about 2 W (hence the warnings about blowing it up if you connect a phone directly to that input).

It appear the only thing needed to get that higher level input working is a bit of rewiring to put the attenuator back into the path. I'm not sure what's required to do a calibration, but worst case there's an Input Offset Level in the Configure screen which can be used to recalibrate that input.

So, my future project is to get a 400 mm bulkhead BNC to SMA cable, a 200 mm SMA to right angle SMA cable, and make that port useful again.

Also, from somewhere I found that saving a config as "POWERON" causes that to come up automatically on, yes, power on (annoyingly, the screen is messed up by the warning message). I also found that a "PRESET" config will come up when you press, yes, the Preset key.

From: Garret
Topic: 1457  Message: 1457

I would like to procure a few cards to use for loading software, such as the RF Tools and some of my own. But I understand there are only certain cards which are compatible with the 8934C. Could someone give me some quick advice on which cards to look for? Is it a Type-I, II? or particular voltage or memory size that works best?

Thanks,
Garret

Hi Garret,
Type I or II does not matter, but you need a card which supports linear addressing, not the ATA (IDE Hrd disk emulation) interface used by later Flash cards and CF or SD to PCMCIA adaptors. This means a battery backed up static RAM card or a linear Flash card. As the 8924C won't format or write to a Flash card you need a PC (laptop) with a PCMCIA slot and software such as ELAN's Memory Card Explorer (MCE) to program the card. Try to avoid Linear Flash cards that need 12V to program as many PCMCIA card slots don't support them for writing. You cannot use Flash for storing instrument set-ups etc, it must be static Ram for this but it can be smaller. You can load a program from flash then pull the card and put a RAM card in to store variables. The 8924C will keep the program in NVRAM even when switched off. I sell a programmed (11807E opt 100) flash card for $50 to list members.

Robert G8RPI.

Robert -

I would like to get one of your cards. Please let me know how to pay you.

Also - I have a battery-backed SRAM card that I would sell for $50, if anyone wants one.

There is a back-up battery on the circuit board that supports the plug-in memory card. This battery keeps the stored POWERON setup memory alive. Its nominal voltage is three volts - if it is less than 2.8 it should be replaced. You have to take the board out to check the battery, but it's not difficult to do.

Glad you got it working.  There is that mistake in the web page.  As you found out, you have to make sure you spell it POWERON.

When you do this, it not only saves the screen that is showing, but you can also configuer the other screens the way you want them to show up and when you goto them, they will also come up as you left them, when you go to them,  when you saved the power on configuration. Good way for the transmitt and receiver test screens to be preset for tests you most often use.  You can also save other setups that you often use, say you frequently tune a duplexer to the same frequency.  Save that the same way and give it a name of anything but POWERON or BASE.  Then you can recall that and save some time.  Not sure what the limit is, but you can save a lot before the memory runs out.

Mark,

It worked exactly as predicted, you gave me the solution buddy, thank you and now to enjoy my "new" HP8924C thank you all who responded and take care.

Pete..

It IS a typo - I'm surprised they haven't fixed it.

Actually, they show it properly as POWERON in other places in the write-up, but in the one place where it matters, they leave out the "E".

The 8924C will save the setup if you call it POWRON (you can save setups under any name you choose), but when the machine is first turned on, it only looks for the correctly-entered "POWERON" setup.

So, if you mistakenly save it as POWRON, it's there, but you have to recall it manually.

In the upper right push the RECALL button.  Select the one you want to delete.  It will be the name in the upper left of the screen.  Notice what it says after it.  OFF clears.  Push the OFF button on the 8924c.  It is the one under the 0 on the key pad labled ON/Off.  The screen will give you one more chance not to do it.  If you are sure, press the ON/OFF button one more time.

It will not hirt to leave it in.  The 8924c never looks at it unless you press the TEST button.

As I mentioned you can set the 8924c to do other tests and you can save them using differant names.  Then just push the RECALL button and select the test you want to run.  YOu can use almost any name you want except POWERON and BASIC.  When you want to run the test, just hit the RECALL and select the test you want to run.  If at anytime you want to get to the poweron state, you can do the same thing, RECALL the POWERON.

It is going to take a lot of button pushing and seeing what hapens to understand this unit.  Being retired and just use it for my hobby, I spent about  a month or two playing with it about an hour every day or two.  The books are not all that helpful, but if you download all the stuff on the 8920 units and look at them it will be a big help.

# 1471. 8924C RF IN/OUT Problem. 10dB down. Any ideas?

Yahoo group: hp8924
Date: 2013-03-31 17:41:41 UTC
From: Garret
Topic: 1471  Message: 1471

I just received my new (to me) HP 8924C. It seems to work ok, except that when I perform a test through the "RF IN/OUT" port, everything reads about 10dB down.

For example, if I connect a 10 watt transmitter to the RF IN/OUT port, it reads only 1 watt. When I generate with "RX Test" mode, it generates about 10db less than what is displayed. If I switch to the "Duplex" port, it generates what is displayed correctly.

I haven't tested everything, but it seems to work ok with everything else I've tested. Receive sensitivity appears good through the "Antenna" port.

This unit has the 100 watt option and the 400KHz - 1000MHz option.

Any help would be greatly appreciated. Hopfully, I just forgot to push a button somewhere.

Thanks,
Garret

Topic: 1471  Message: 1474

Mike,

All of the offsets in the configuration menus were set to "0".  However, I have discovered that if I enter -12dB for the RF IN/OUT port, it pretty much makes both the generate and receive read exactly correct. Interesting that this is somewhere close to the loss due to the power attenuator in the 100 Watt option, as compated to the standard 3 watt input.  I can't help but wonder if everything is ok physically, but there is a calibration value that is set wrong somewhere?

With the RF IN/OUT offset set this way, it works ok, but I lose the offset amount from the maximum generator output, when using the RF IN/OUT port.  For example, I can generate +18dBm from the Duplex port, but only +6dBm from the RF IN/OUT port.

Is there a place to set calibration values other than the "Offset" values in the Config screen?

Thanks for the help.

Garret

No, I have not tried the built-in calibration routines.  Not even sure how to run them.  Need to go read the manual...

After looking at the block diagram, I get the impression that the power attenuator is in the RF IN/OUT circuit no matter what, and that there will always be a loss due to it.  If so, then I suppose there must be a calibration value to compensate somewhere?

For what it's worth, I have verified that the input does still appear to represent a 50 ohm load ok, and that the problem with the RF IN/OUT port seems to be the same across the frequency range.  So I don't think it's a burned up load anyway.

If it is the input assembly, any idea what that would entail to repair? Keeping in mind this analyzer has the 400KHz option, with relays and such.  I paid a lot for this, and it came with a guarantee, so I think the seller will make it right.  I just need to know what is right!

If you look in the files section you can find the calibration programs for the differant input values.  I don't know how or if you can check to see what the 8924c is calibrated at.  It may have origionally been for a lower power input and when  the input attenuator was changed, it was not reprogrammed.

You can run the calibration if you can load the program on a pcmcia card.

I am thinking there is more power out of the duplex out than the RF in/out port.  You can look that up in the specs of the 8924c.

The Duplex and antenna jacks appear to work correctly.  If I apply the -12dB factor to the RF IN/OUT port in the config setting, then the RF IN/OUT and the Duplex match exactly as they should.

After looking at the spec sheets, I see that the high power input options do reduce the generator output from the RF IN/OUT in proportion to the opton's power rating.  This tends to confirm what the block diagram shows - that the power antennuator is always in the circuit for the RF IN/OUT port.  This is leading me to think it's just a calibration issue.

This unit is supposed to have the factory 100 Watt continous option 016 and the factory 400 KHz option 055, so no one should have been modifying it for high power. It does have the factory nameplate that shows 400 KHz - 1000MHz, and the factory warning plate for 100 Watt on the RF IN/OUT port, so it all looks official, superficially.

I do not have a PCMCIA memory card, so I guess I'm out of luck on running the calibration routines, at least for now.

Thanks,

Garret

I can't help but wonder if everything is ok physically, but there is a calibration value that is set wrong somewhere?

With the RF IN/OUT offset set this way, it works ok, but I lose the offset amount from the maximum generator output, when using the RF IN/OUT port. For example, I can generate +18dBm from the Duplex port, but only +6dBm from the RF IN/OUT port.

Is there a place to set calibration values other than the "Offset" values in the Config screen?

Thanks for the help.

After reading all posts on this it does sound to me that an 100W attenuator has been installed but the calibration routine has not been run or it has been inadvertantly calibrated back to the factory 3W standard. Could also have had the card with cal eeprom replaced / repaired. You'll need to get hold of a PCMCIA SRAM card and follow the procedured in the the group files section (Attenuator Calibration). I'd be talking to the supplier. 73s de chris zl1cvd.

Garret, Chris,

Here is a resource for PCMCIA SRAM cards:

http://www.amtron.com/sram.htm

Others can be accessed via Google. I purchased a 1 MB coin-battery card from Amtron for my Agilent 8935, and it is of excellent quality.

(Crossposted from hp_agilent_equipment@yahoogroups.com)

Clive;

You are correct, on page 80 and 83 of the 8920 Application Handbook, those drawings are in error.

The speaker audio of the receiver under test should be measured at the audio in connectors on the front panel. You have option of balanced or unbalanced audio input.

Go to this website you can download all the manuals including a link to an MP4 video showing how to operate the test set for common tests.

Chris,

I now suspect you are correct, that either the attenuator was recently installed, or boards swapped, or some combination therof.

If I understand correctly, I can get an appropriate PCMCIA SRAM card and put the calibration routines on it. I can then properly recalibrate it and the software will write the new calibration values to the eeprom?

The vendor I bought it from said he will fix it.  But I will have to ship it back and forth accross the country.  I hate to do that if it's something I can do myself without too much trouble, especially considering that I would like to know how to calibrate it anyway.

It does seem to work really well otherwise, and when I put that offset in the config screen, it works perfectly and looks like it meets all of the specs for input/output power.

Thanks everyone for the help.  I'm off to find a PCMCIA card.

Ask if the dealer will send you a card with the calibration on it.  It should not cost him but a buck or two to send the card, then you can run the program on the card and send it back to him.

About a year ago on ebay there was a fellow that I bought an upgrade from the low power to 60 watts input.  He billed my credit card for about $ 50 extra to send the calibration card with the understanding when he got the card back he would credit my card the $ 50.

Everything went fine.  I took out the low power unit that was about the size of a postage stamp and as thick as a dime.  Then soldered the new one in.  There is a dip switch or two that have to be flipped inside the 8924c that allows you to write the new program.  Then you put the switch back.  Not bad to do if you have to take it apart to install the new atteunator.
 Seems like there were about 40 screws to remove and replace..

Look close at your unit.  See if at the RF IN/OUT is printed on like the warning on the antenna port, of if you can run your fingernail over it and it is really a sticker.  The sticker was part of the factory upgrade kit.
If it has a sticker, it could have started out as a low power unit.

For that , there is no real calibration, just a softwear change to tell it the attuenuator value.

I agree Ralph. The vendor should send the correct calibration data on a card - even if he charges a refundable deposit upon return.

As I understand it, the calibration data on the group website was only intended for the original attenuator module it shipped with. Every attenuator exhibits a slight attenuation variance across its frequency range. The data file reflects this and the program simply loads the data file into the 8924 calibration eeprom. There is no true calibration done on the fitted attenuator. I can't recall if there was another internal calibration routine that can be run to correct any fitted attenuator variance. Maybe another more experienced group member can advise this.

Cheers, Chris ZL1CVD

Welcome to the group Magne.

Check is how dusty the set is inside. The units I have worked on were all pretty dusty inside. Some errors were fixed by removing all modules, vacuuming the dust out of connects, modules, cards & cleaning fan blades to ensure cool quiet running.

But, good spotting the out of lock LED as these generally indicate a power supply issue - specifically the +40V (synthesizer VCO tuning voltage). Allot of issues with an 8924C (& 8920, E8285, 8935 series, Etc) can are cured by replacing all electrolytic caps in the SMPSU and regulator units. Its a fairly painless but tedious job - lots of screws to undo, redo, plated through PCB's to desolder, etc. Alternatively, search eBay do replacement supplies - some sellers credit you back for the old supply.

Cheers, Chris ZL1CVD

Chris's suggestion of removing and refitting cards is a good one. Be very careful with the vacuum cleaner though unless it's designed for use on electronics. normal vacuum cleaners can generate a lot of static electricity (plastic hose, brush bristles and moving air are all possible sources) and may zap your electronics.

From: c_day_nz
Topic: 1490  Message: 1491

I haven't found a way to do this other than sourcing the original HP firmware files. My experience with E8285 (effectively same as a 8924C for this discussion) is the upgrade routine loads images into multiple EEPOMS on multiple cards: controller, DSP & protocol processor. Each of the cards has its own UP or DSP and they all communicate via serial. If one or more cards has a revision of firmware that is not compatible with another, it fails to boot. The firmware upgrade routine also does a check on its binary files and refused to upload firmware data files I hacked due to invalid check-sum. The real time operating system on 8924/E8285 is pSOS-6800 by Software Components Group ☐ now defunct. FWIW there is an open source PSOS+ product called Reliant which could be used to run on these com test sets but the development cost would be huge. It would probably cost less and be more efficient to throw in an ARM controller. Cheers, Chris ZL1CVD

# 1492. Replacing video pots?

Yahoo group: hp8924
Date: 2013-04-05 19:20:47 UTC
From: technicavolous
Topic: 1492  Message: 1492

I have shaky and rolling video. Twiddling with the pots in the video board eventually I can get things to stabilize for a while then it happens again.

I understand this is fairly common.

Does anyone have a description of what order things should come apart to remove that section and replace the pots? Is it straightforward? I've had the cover off but have been reluctant to go further yet.

Thanks
Tracy N4LGH

From: Robert Atkinson
Topic: 1492  Message: 1493

Hi Tracy,
When you say the video board do you mean the monitor module (A3)? The video is generated digitally in the CRT Drive (A22) so there is no timing adjustment. I've not seen this fault on the 8924C, but experience of the unit and similar faults would indicate faulty capacitors rather than presets. Presets (of the quality used by HP) tend to either fail completely or recover for a long time when "tweeked" to clear a bad contact. They do not tend to drift.

Robert G8RPI.

I think if you look on the Agilent site you can find a service manual that will tell you what to remove.

Look for a file labled 08924-90061.  It is a service manual about 11 megs in length.
I am not sure if anyone put on the files here or not.

Another common problem - CRT unit leaky caps = lack of video lock, blurry, shaky, Etc. I'm picking the pots will be fine but the caps will be leaky. Replace them with 105 degree C caps - it gets warm inside an 8924..

I'm curious; does anybody know if the capacitor problem is limited to the CRT module or does the problem exist throughout the entire instrument? I think my display is having cap. issues (haven't had time to open it up yet) and wondering if its worth repairing. If capacitors throughout the entire unit need to be replaced, that could involve many hours and get pretty costly just for the caps, especially if I replace them with tantalum equivalents.
Thinking that it might be better to just cut my losses and scrap the thing out if the problem is too extensive.

Hi Tom,
The power supply capacitors can also give trouble, but I don't think en-mass replacement of capacitors on other boards is justified. The only non-PSU or CRT capacitor failure I've seen was a front panel keyboard failure caused by a failed tantalum, it had been installed backwards from new (timing circuit so no low impedance supply to cause immediate failure). It's electrolytics in high stress and temperature applications like switch-mode PSUs and CRT monitors that give most trouble. DON'T replace wet electrolytics with tantalums. Solid tantalums have different characteristics and can cause issues. Use quality 105 deg C rated electrolytics.

Robert G8RPI.

Topic: 1492  Message: 1499

Hi Robert,
Thanks for the reply and heads-up on using tantalums. I suppose the same would be true for a radio I'm changing out as well. I bought tantalums for it but, fortunately, haven't had time to put them in yet and, so far, the old ones are not leaking so guess I'd better order electrolytics for it too. I naively thought they were interchangeable at will. Guess some reading is in order.
Wonder if anybody's made up a list of the caps. needed for the display yet. Hate to reinvent the wheel if not necessary but, if nobody speaks up, guess its my turn to make a list with pn, etc.
Well, I finally cleared off a space to take the thing apart so, hopefully, tomorrow I'll know what the fix is going to be
Tom

>
> Hi Tom,
> The power supply capacitors can also give trouble, but I don't think en-mass replacement of capacitors on other boards is justified. The only non-PSU or CRT capacitor failure I've seen was a front panel keyboard failure caused by a failed tantalum, it had been installed backwards from new (timing circuit so no low impedance supply to cause immediate failure). It's electrolytics in high stress and temperature applications like switch-mode PSUs and CRT monitors that give most trouble. DON'T replace wet electrolytics with tantalums. Solid tantalums have different characteristics and can cause issues. Use quality 105 deg C rated electrolytics.

> I'm curious; does anybody know if the capacitor problem is limited to the CRT module or does the problem exist throughout the entire instrument? I think my display is having cap. issues (haven't had time to open it up yet) and wondering if its worth repairing. If capacitors throughout the entire unit need to be replaced, that could involve many hours and get pretty costly just for the caps, especially if I replace them with tantalum

equivalents.

# 1500. Ongoing repairs to 8935 Powersupply

Yahoo group: hp8924
Date: 2013-04-07 06:11:32 UTC
From: gajas05
Topic: 1500  Message: 1500

Hello to all,
My name is Geoff, for Alice Springs Australia,
I picked up a 8935 Series test set (E6380A) at an online auction a couple of years back, it was going to be a gamble as it was advertised as not working, so I took a punt, being the olny interested party the unit transfered to my love and care & hopefully get better again.

I ended up tracing the fault to a Blown Mosfet in the PSU, & once replaced the unit fired up into life.however..

from time to time while using the 8935 it blows the mosfet again, so either there is another fault in the unit or I have a technical induced issue by way of me replacing the original component with the same as was in it as I received it.

I know that some of the modules between the 8935 8920 8924 8285 ect. are the same but am unsure of the psu.

what I really need is a circuit schematic of the psu to work from, I had a quick look through the files section and browsed through the 8924 circuits but couldn't see anything of interest.

Hoping someone can identify this component atlease I will post a pic of the PCB in the photo section for component identification.

the MSOFET that allways goes is the inner one near the 2 large input capicators on the 0950-3690 board

thanks

Geoff -

People have been looking for the PS tech info for a long time with no luck, so you are probably on your own here.

However, it sounds like your FET is just below the needed specs to keep working.

Try looking for one that has a bit higher voltage and current specs, and a bit lower Rds, in a package type that will mount in place of the original.

And, please let us all know how it works out.

John K.

# 1502. Re: Ongoing repairs to 8935 Powersupply

Yahoo group: hp8924
Date: 2013-04-07 16:31:24 UTC
From: robert8rpi
Topic: 1500 Message: 1502

Hi Geoff,
I don't have a circuit or even a 8935, however from your description of the fault and knowledge of switch mode supplies I'd suspect a failed snubber circuit. Snubbers are a series resistor and capacitor connected across a switching transistor (or mechanical switch) to limit the rate of change of voltage (dV/dt)across the the device. Excessive dV/dt causes EMI and stresses the transistor. A failed open snubber won't stop the circuit working but may allow dV/dT to over stress the transistor. If the transistor is working close to the edge of its specification it may fail quickly. If it is conservately rated it may last some time beore failing. Most likely the snubber resistor has failed open. Less likely is that the capacitor (film or ceramic) has failed open.

Hope this helps,
Robert G8RPI.

Guys,
Thanks for the comments, The Mosfet that is currently in the unit is a IRFP460, This is slightly higher rated than the component that was fitted when i received the unit, ( from memory the original part was a IRFP450 but I don't know if that had been substutited before I got hold of the unit. ( hence my request for identification of the component.

next time it throws a micky I will have a close look at the snubber curcuit & see if i can get any more clues.

I picked up a pack of 10 Mosfets for it ex china for about $12.00 so its not a great expense to repaire each time, just a a mission from hell to pull the thinkg down & rebuild.

# 1504. Replced Video Board

Yahoo group: hp8924
Date: 2013-04-16 00:48:09 UTC
From: technicavolous
Topic: 1504  Message: 1504

Just reporting in to let you all know I successfully replaced the boards in the video 'cage' as I call it. The fellow 'Joon' had sent me a replacement module but his 'new' tube was burned much worse than mine. Mine is actually just fine, the boards had broken pots so I swapped those and all is well.

While I wasn't very happy getting a 'refurbished' unit that had significant video problems, Joon went out of his way to make it right without my sending the unit back to him which i refused to do ;]

Now if I could just get that '8220 going with a VGA monitor all would be great! I'll put that in a different post ...

Topic: 1505  Message: 1505

I have built the LM393 'Sync Separator' circuit a couple times and still can't quite get this thing to stay up. It will 'capture' one distorted screen and freeze.

The first time I had been a little loose on the wiring, so I re-did it thinking maybe I had too much exposed signal line. This time I Did it microwave style deadbug and still the same. I'm using the RGBS input.

The only difference is I have the dual output board vs the single - could that possibly be a difference?

Tomorrow I should receive some LM1881's and I'm going to have another go at it. So far this is the only thing I haven't been able to conquer on this beast ;]

Hello All,

I'm new to the group and have committed the bonehead move of the month (ok, the year). I inadvertently transmitted into the Duplex BNC connector with about 15 watts at UHF for a couple of seconds. A moment later I detected the dreaded smell of something hot. The 8924 still seems to function, however the some of my readings are now several dB off from what they were before I let the smoke out. For example, I swept a re-swept a UHF duplexer that I looked at a few minutes before and the insertion loss shows to be about 3 dB more than before even after I normalized the settings. Any ideas what might have been zorched?

Thanks!

Hi Mike,

Yes, I was headed toward that neighborhood. The unit is built like a battleship and dis-assembly is very straightforward. I have done a fair amount of SM work. I appreciate the info on relevant documentation. Before I button it up, I'll introduce it to my air compressor (I can't believe how filthy these things get). I'll give this a day's effort. After that, I'll box it up & send to Amtronix.

Thanks again for the info.

Rod,

Almost certainly something in the RF Input Assembly is cooked.  I don't have my -8924 manuals on this computer so I'm looking at an -8920 manual, but both test sets use the same assembly.

It's a bit of a bugger to get to and it's full of SMD components.  You CAN troubleshoot and repair it; many of the parts are available at Mouser - it just takes a little more diligence to work on the SMD stuff if you're not used to doing it.

The Internet will lead you to an HP-8920B Assembly Level Repair Manual, an HP-8920A-B and 8921A Test Set Assembly Level Repair 08920-90168, and an HP-8920 Component Level Information Packet.  These will all be useful for the -8924 RF Input Assembly.

Good luck.

Rod,

If you've done SMD work, you have a good chance of fixing it. One advantage I had was a 2nd service monitor. I injected a signal and traced it through the input assembly with a the spectrum analyzer on the other service monitor; pretty easy to see where things went South from there.

I'm new to the group and have committed the bonehead move of the month (ok, the year). I inadvertently transmitted into the Duplex BNC connector with about 15 watts at UHF for a couple of seconds. A moment later I detected the dreaded smell of something hot. The 8924 still seems to function, however the some of my readings are now several dB off from what they were before I let the smoke out. For example, I swept a re-swept a UHF duplexer that I looked at a few minutes before and the insertion loss shows to be about 3 dB more than before even after I normalized the settings. Any ideas what might have been zorched?

Thanks!

Rod

# 1513. Re: Replacing video pots?

Yahoo group: hp8924
Date: 2013-04-20 02:58:26 UTC
From: wb6dgn_tom@att.net
Topic: 1492  Message: 1513

A progress report on my 8924 video problem.
I finally got time to remove the cover and look things over. First thing I noticed is that the interior of the monitor was just loaded with thin, powdery, sticky dust (what does that say about my housekeeping?).
That lead me to the pots on the display which I had somewhat discounted before. Sure enough; as soon as I put the tool in the brightness pot, before I even tried to turn it, the display stabilized. I turned the monitor off and ran the pot back and forth through its travel about a half dozen times and turned the monitor back on. While I was able to adjust the brightness as Rick at Amtronix had told me to, I found lots of dead spots in its travel so I'm sure it is going to need to be replaced soon. I did order some DeOxit in a needle dispenser to try before I replace the pots but the disappointing thing is that, in order to clean the pots, the display looks as though it has to be removed from the monitor. So, my question is; do I even bother with trying to clean the pots, knowing that I may have to go through the, not so trivial, job of removing the monitor a second time? Kinda reminds me of the old movie line, "Do you feel lucky today...?"!
Anybody with any advice or suggestions, your thoughts are appreciated. That way, if I make the wrong choice, you can share the blame with me!
To be continued.....
Tom

From: technicavolous
Topic: 1492  Message: 1514

I *JUST* went though this procedure. It's much easier than it looks at first.

I had purchased my monitor from 'Joon' on EBay, so instead of just replacing the pots he sent me a new video assembly. The tube in the assembly he sent me was way worse than the tube I had, but the board with the pots on it was good so I swapped out the boards with my unit.

Works!

The amazing thins is how easy the front panel really was go get off. After you remove the cover, there are four screws, two on each side of the front assembly to remove it. It will seem 'stuck' as there are very strong copper fingers between the front and the bottom. Pry it off with a large flathead.

Once the front is off there are a few cables to disconnect, some are fairly delicate so be careful with the SMA lines.

After that, there are a handful of little screws holding the glare panel of the display on, they all need to come out. Take the plastic cover and gently lift it forward from the bottom to remove it and expose the screws. Then there are a few more larger ones (four) that hold the major weight.

Once these are our you can slide the display assembly off of the front panel.

The top of the display cage comes off and the boards have two screws each on top and slide into grooves in the cage. The whole assembly is easy to remove, then you can get to the pots and replace them.

I did use cleaner / lube on the replacement boards pots before I put them in, I was actually worried I was just putting in another problem board but when I put it back together and fired it up it worked first shot, no adjustments necessary.

The one thing you have to remember is if you took the inside top covers off you have to put them back on before you power up the unit. There is a note on one of the covers stating the power supply will overheat in 90 seconds if that lid isn't on.

So I'd say make sure you have a fairly large bench to work with, separate and note your screws, and go for it!

Now that I got this going I'm off to connect a VGA monitor and start learning RFTools and IBasic.

For those removing the front panel, you may find that the copper finger stock is in bad shape and tears up. I had this problem a couple years ago and decided to replace it. I bought the replacement from Fair Radio Sales. It even had the adhesive on it to hold it in place. I just checked and they still have it. Part number is 97-555-02

Well worth the $8 if yours is in bad shape.

Thanks, Fred, for the heads-up. Since you've been through it, do you have any suggestion for a way to minimize the damage when removing the panel? I haven't gotten around to doing that yet but whatever you can offer would be appreciated. Also, is there an item number or part number for the replacement finger stock? Think it would be worth keeping that "in stock"

From: radioman762
Topic: 1517  Message: 1517

After working fine last night, my 8935 refuses to power-up this morning. I assume that it is the classic power supply problem.

My question is whether the 8935 uses the same power supply as the 8924. I have a spare working 8924 supply that I could drop in.

I admit that I haven't gone to the manuals yet, but if someone already knows the answer it would save me a lot of time.

Thanks.

# 1520. HP8924 Owners in Washington DC Metro - Looking for help

Yahoo group: hp8924
Date: 2013-05-23 00:37:23 UTC
From: Michael Dye
Topic: 1520  Message: 1520

Looking for someone in the Washington DC Metro area with a HP8924 that would be willing to help out with tuning a UHF Duplexer and Kenwood TKR-850.

Barring anyone local actually having one, I am looking to purchase one from Amtronix but would appreciate any help in getting going. I'm sure it's going to be a steep learning curve.

Any help would be much appreciated..

Thanks, hope to start picking up some good info here..

-Mike

Mike,

I purchased my HP8924C from Rick@Amtronix and I am totally satisfied, you cannot go wrong with him. I have had mine for about two months now and what I have done is focus on specific tasks at a time, right now I have managed to tune VHF/UHF duplexers and even a two channel UHF combiner ( you have to look at Brian Swann videos on YouTube to get a real idea of what to do http://www.youtube.com/user/n1bsbri ) one BIG piece of advise: Invest the money in the Return Loss Bridge from Rick if you are serious about tuning duplexers the right way. My next task is tuning the Kenwood TKR-850 repeater, you are right about these units having a steep learning curve but is not impossible buddy. Wish you the best, good luck.

Pete..

Mike,

I use my repeaters for commercial use only (no ham service)
one thing I can tell you though is that the TKR-850 repeater has to be
tuned or at least checked out with a proper service monitor like the
HP8924C ( take a good look at the service manual page 42 under
"Adjustment" so you can have an idea of what needs to be done on it
http://www.repeater-builder.com/kenwood/pdfs/tkr-850revised.pdf ) as far
as the duplexer you are getting  if it is something "inside" the
repeater is probably a "notch only" duplexer and that is real easy to
tune using the HP8924C. You may have to send the whole system to be
tuned by a professional so you can get 100% out of the system. I am in
Central America so I cannot help you directly, sorry. I cannot recommend
anybody directly but I have emailed in the past with "The TKR Guy" in
the past and he has been helpful http://www.thetkrguy.com/ even though
he works on the older TKR-820 repeaters maybe he can point you in the
right direction. Good luck.

 Pete..

Pedro,

Are you using your TKR-850 as a repeater in 70cm ham band?  Is it really necessary to
re-tune it?  I'm hearing back and forth, some say it's fine out of the box (Type 1
450-480mhz model), others are saying to tune it.

Was the duplexer you tuned part of the TKR-850?  Mine has a internal duplexer, I haven't
seen it in person yet - Should here Friday, but I'm hoping it's pretty straight forward to
tune.

So far I have been unable to find anyone local that has a HP8924C, or anything even close
to it to tune the duplexer and radio (if it indeed does need to be tuned, hearing
conflicting information so far).  Just not looking forward to that huge cost just to setup
a local d-star repeater. :(

Topic: 1523  Message: 1524

The 8924c is 7 inches high, 17 einches Wide and 25 inches long if  you count the two back legs that should be on it.  You will allow some room at the back as that  is where the poewr cord comes out, but if you have one of the right angle ones, you can run  it that way.  The heigth is not counting any legs that may or may not come with it.  Mine does not have any on the bottom.

Also at the back are some BNC connectors that I doubt you will use.  There is a connector that looks like a telephone or rj 45 but it is 6 pins if I remember correctly that you can hook up a computer to do a screen print.  Also is the DC current jacks to measure 10 amps DC if you want to.

It weighs one ton..  Atleast that is what you will think...Actually around 60 to 65 pounds.

I bought a Craftsman tool box to put mine on.  Payed just over $ 100 and has severl draws.
Also put a couple of boards  at the front to  angle the display up.
The 8924C just fits on that tool box.  They do have a smaller box that it will not fit on.

Plan on spending a lot of time to learn how to use it.  It is not that difficult, but it does so much.  The manual for it is almost worthless.  Look for the 8920 manual.  While the buttons are in differant places and may be labled differant, the screen displays look almost the same.  Just play a lot with it and push the buttons.  Except for putting too much power into it, it is doubtful that you will do anything to hirt it.
There are some good you tube vidios that are for an E8285 or something like that.  The buttons are in diffreant places, but the screen shots are similar and will give you a good feel of some of what it will do.

Also go here for some info.

excellent, it will fit fine, I have been studying the manual on here and it looks like it will do everything I might want to use it for in my shack, all I have to do now is save up enough money to buy one, hope they is one left for me,
I am a experimenter, and like to build different test gear, and play with antennas, also do some repair on equipment with other hams.

I have a used audio visual cart with power strip and two shelves that I bought at local school board auction. It moves freely and cost about $10. It is rectangular and 8924C sits on top with laser printer on bottom shelf and adapter/cables/connectors etc on mid shelf. I have seen these at other local school board auctions for as little as $5 and as much as $25. I took 20 of them to Huntsville hamfest 4 years ago and could not get them unloaded fast enough for $30 each.

I use a wooden microwave cart for mine. It rolls easily, has a small drawer, a door with a couple of shelves behind it and some external shelves. I fastened a power strip to it to power the -8924 and the laptop computer that sits on top of it. On the opposite end I attached a cable rack for some of my shorter test cables. There is enough room behind the instrument for a fishing lure box full of adapters.

Plenty of possibilities, but no matter what you□ve just about got to get the -8924 off your bench and on to some kind of cart!

73,

Mike

I have a used audio visual cart with power strip and two shelves that I bought at local school board auction. It moves freely and cost about $10. It is rectangular and 8924C sits on top with laser printer on bottom shelf and adapter/cables/connectors etc on mid shelf. I have seen these at other local school board auctions for as little as $5 and as much as $25. I took 20 of them to Huntsville hamfest 4 years ago and could not get them unloaded fast enough for $30 each.

The 8924c is 7 inches high, 17 einches Wide and 25 inches long if  you count the two back legs that should be on it.  You will allow some room at the back as that  is where the poewr cord comes out, but if you have one of the right angle ones, you can run  it that way.  The heigth is not counting any legs that may or may not come with it.  Mine does not have any on the bottom.

Also at the back are some BNC connectors that I doubt you will use.  There is a connector that looks like a telephone or rj 45 but it is 6 pins if I remember correctly that you can hook up a computer to do a screen print. Also is the DC current jacks to measure 10 amps DC if you want to.

It weighs one ton..  Atleast that is what you will think...Actually around 60 to 65 pounds.

I bought a Craftsman tool box to put mine on.  Payed just over $ 100 and has severl draws.
Also put a couple of boards  at the front to  angle the display up.
The 8924C just fits on that tool box.  They do have a smaller box that it will not fit on.

Plan on spending a lot of time to learn how to use it.  It is not that difficult, but it does so much.  The manual for it is almost worthless.
Look for the 8920 manual.  While the buttons are in differant places and may be labled differant, the screen displays look almost the same.  Just play a lot with it and push the buttons.  Except for putting too much power into it, it is doubtful that you will do anything to hirt it.
There are some good you tube vidios that are for an E8285 or something like that.  The buttons are in diffreant places, but the screen shots are similar and will give you a good feel of some of what it will do.

Also go here for some info.

There have been several good ideas for a cart.  Unless you plan on just using it in one spot only , a cart of some kind is the way to go.  At 60 pounds you are not going to want to move it around very much by hand.

I just use mine for hobby.  My ham shack is in the basement.  It is on one side and the work bench is on the other side.  Not enough room on the bench for it anyway, but even if it was, I would not want to carry it from one place to the other.

I do carry it to a repeater , but it is lucky the repeater is in a 6 foot by 6 foot building on the ground so I do not have to carry it up any steps.  The basement is a walk out without any steps also.

The scope on mine does have some burn in, but not too bad to look at when it is in use.  If I was worried about the burn in, I may be tempted to get one of the vidio adapters and an external monitor that is larger.

I don't know from doing, but I have heard it is much easier to replace the whole scope assembly than it is just the tube and from what  I have read ,the prices is not that much differant.

There used to be a lot of the 8924c on ebay but the other day when I looked there did not seem to be very many , especially under $ 1000.  I forgot what I payed for mine.  It had a 3 watt input limit.  Someone was selling a 60 watt with a 100 watt limit for 10 seconds upgrade and I bought that.  Even then I had less than $ 1000 in mine.  Took a while to install it as there  are lots of screws holding the thing together. I used a cordless drill to remove and start the  screws back in.

I don't know the details of the upgrade. I didn't find any release notes.
My 8924 was at v 6.x and didn't match some of the instructions I was trying to follow (they were labeled as being for v 7.x or later), so I thought this would solve that. After updating to v a.08.04, the analyzer STILL doesn't match the instructions. HA!.
But it's done. I'm selling for the same price I paid on ebay for this.

By the way - this set of cards is already sold.

Hi Tom,
Thats slightly cynical. Actually Agilent (HP) have a progrssive attitude to sharing manuals and software for instruments that are no longer supported by them. An earlier version of the firmware is in the files section already. It's not as if the firmware is of use on any other equipment.

# 1540. HP 11807E Opt. 100 on Agilent 8935

Yahoo group: hp8924
Date: 2013-06-05 07:31:39 UTC
From: Adam Farson
Topic: 1531  Message: 1540

Hi Robert,

I have an Agilent 8935 E6380A with 2002 firmware, and an HP 11807E Opt. 100 card. I have found that the only program on the card which will run in the 8935 without crashing is Save/Recall Registers. The other programs all crash with string errors.

Do you know of any "tricks" for starting these programs correctly on the 8935?

From: Ralph Mowery
Topic: 1531  Message: 1542

This probably will not help you unless you know how to work with the HP Ibasic.  A while back someone posted the RF Tools Program.  I could not get it to work with an 8924c.  Someone named KLYBALL found out the needed changes to make it work.  You can use Wordpad to edit the files.  Here are the lines that were changed for the 8924c.  You may be able to edit those lines to work with the 8935.  I assume that the program checks for the version of softwear, modle number and some of the options installed in the test set.

A. Make these changes***for Ts_rev$[3])>=08 use the first # of your firmware mines A.08.04***

```
1134 IF Ts_mod$="HP 8924C" OR (VAL(Ts_rev$[3])>=08 AND Cur$="YES") THEN
1397 IF Ts_mod$="HP 8924C" OR VAL(Ts_rev$[3])>=08 THEN
14002 IF Ts_mod$="HP 8924C" OR VAL(Ts_rev$[3])>=08 THEN
```

```
1334 ! IF POS(FNTs_mod$,"8921")<>0 THEN
1335 ! IF POS(I_o$,"TACS")<>0 THEN
1336 ! Flt_1$="CCITT"
1337 ! ELSE
1338 Flt_1$="C MESSAGE"
1339 ! END IF
1340 Flt_2$="6KHZ BPF"
1341 Cur$="YES"
1342 SUBEXIT
1343 ! END IF
1344 IF POS(FNTs_mod$,"8924C")<>0 THEN
```

```
13640 IF FNTs_mod$="HP 8924C" THEN
```

```
13651 IF FNTs_mod$="HP 8924C" THEN
```

```
14027 ! To_ts("*RST")
```

```
14017 ! To_ts("*RST")
```

B. Use the POWERON register

C. Set squelch control on in customize test procedure: Set up frequencies and any othe parameters you need

D. turn on Data collection if you want to get a file (i will upload the manual

E. Run the program

good luck

# 1543. 8922M firmware load

Yahoo group: hp8924
Date: 2013-06-13 23:49:21 UTC
From: aj4ks
Topic: 1543  Message: 1543

Hi! I have an 8922M and would like to remove the 010 option from it. This was discussed on the list last year, and it was revealed that units were converted in the field by rearranging some internal connections and loading "option 010" firmware.

The 8922 repair manual states that most models have ROM chips but for the 8922M, the firmware load is carried out "using an external controller or Personal Computer."

Can anyone reveal to me more details about this process, such as the host and software required, or share the image files with me?

Thanks & Cheers
Ken AJ4KS

# 1544. 8200 conversion, new feet and another 8924c....

Yahoo group: hp8924
Date: 2013-06-20 23:26:16 UTC
From: nolimit3o3
Topic: 1544  Message: 1544

Well i just ordered my 8200 and all the parts i need to modify it and use it on the 8924c. Went with the LM1881 since i dont have a scope on hand, hoping this is the best option lol. Also found a guy on ebay selling WHOLE sets of feet for HP test equipment, looks like they will work on the 8924 as well, so if anyone is looking for some new feet for their units, its ebay item number: 161034074523 it says he only has 2 left right now, but he's relisted these a few times so apparently he has a number of them on hand :) And lastly, if anyone is looking to buy another or need to buy a 8924, Rick from Amtronix has one on ebay right now with new display and refurbished, calibrated and 180 warranty for 1600. I remember a few people awhile back where looking so figured i'd toss that out there :)

Hope everyone has a great weekend!
David

# 1545. HP 8935 Power Supply Problem Solved

Yahoo group: hp8924
Date: 2013-06-26 17:02:26 UTC
From: radioman762
Topic: 1545  Message: 1545

Some weeks ago, I mentioned a problem with my 8935 that seemed to be due to a "dead" power supply.

Today, I finally got time to pull the supply. In the process of removing the covers to get to the supply, I noticed the GFI on the rear panel. I had forgotten that it even existed, and can't recall if I had actually noticed it. As luck would have it, the GFI had tripped. Resetting it solved the problem. Hopefully, tripping was due to some transient cause that will not soon recur.

The GFI is unique to the 8935, at least when compared to the 8924. It is worth checking if you have a 8935 that suddenly fails to turn on. If I had remembered to check it, I would have saved several weeks of instrument downtime.

I'm posting this info in the hope that it will help others. Often, it is the simple things that should be checked first!

Hello,
All you have to do is go to encoder, change mode to select CDCSS, enter your digital code, set "send mode" to continuous, and set AF Gen 2 to 0.6 kHz.

Now use your generate screen to set the rf level, 1k tone, etc.

That is all there is to it.

Good Luck,
Kev

No problems...we run two of these at work plus an 8920 and I have an 8924 at home as well. One of the best service monitors I have ever used. A bit heavy though.

From: Robert Atkinson
Topic: 1549  Message: 1552

Hi Bob,
You have to use the separate RGB / Sync inputs, hence the need for the separator. You just use the green input for a green display or tie all three together for white. There is info on the group about changing resistors for better levels.

Robert G8RPI.

Subject: [hp8924] 8924C with a gbs-8200 converter

I have ordered my hp8924C and would like to use a gbs-8200 converter to connect a lcd display.

the pictures in the photo section do not show the connections, and I built the sync separator, but then it looks like it should work with out the sync sep.
can somebody please help me with getting this to work.
bob

ok, I think I get it.
the composite sig from the 8924 goes to the white 5 pin connector just to the left of the pots, and to the pin labeled G for green, and the sync goes to the pin labeled S for sync.
then the five volts supply.
also install the 5 50K resistors,
do I have it correct ?

# 1555. Spectrum Question

Yahoo group: hp8924
Date: 2013-07-11 07:05:21 UTC
From: orhanavcioglu
Topic: 1555  Message: 1555

Hello everyone,

Using the new 8924C I noticed something that I could not reason. In the spectrum analyzer mode, if I give a signal to 442MHz at 0dBm amplitude, shouldn't I observe the marker level at 0dBm at the same frequency? Please check <http://groups.yahoo.com/group/hp8924/photos/album/1593620226/pic/616137\573/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc> this photo <http://groups.yahoo.com/group/hp8924/photos/album/1593620226/pic/338359\664/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc> from photos section that I just uploded. However, when my signal level is greater than -20dBm, I can see exactly the value I should. For example, if my signal strenght is -30dBm on the RF Gen, then the level is -30dBm at the marker. But anything below -20dBm is not displayed. You can see some example screen shots in the same album.

For the reference: The output port is RF Out, the input port is Antenna In. They are connected to each other directly via coax cable.Attenuator is on Hold and 0dB.

This makes me wonder what may be going on.. Any ideas?

Thanks!

Topic: 1555  Message: 1558

I think it is because you have the attenuator on hold. Go into the "auxiliary" screen of the spectrum analyzer and change the attenuator to "auto" instead of "hold" and you should notice the correct signal levels being reported by the 8924C. I was able to reproduce your instrument condition by putting the attenuator on "hold" in my 8924C. Hope this helps.

# 1559. 8924c warm up time

Yahoo group: hp8924
Date: 2013-07-16 03:55:19 UTC
From: Ralph Mowery
Topic: 1555  Message: 1559

Does the 8924C require some time after it is pluged in to 'warm up' before the power switch will turn it on ?

I usually leave my 8924c plugged in so the heater part will stay on and warm,but I noticed that when I unplug it for a day or so it may take some time for the power switch to activate it.  The green led visiable from the holes in the back comes on as soon as I plug it in as expected.

As usual the manual on this unit does not mention anything about it that I can find.

# 1560. Re: 8924c warm up time

Mine doesn't. I leave my equipment unplugged, especially this time of year and, when I plug it in, it responds to the switch immediately. Of course, it takes a little while to come up to temp. but you are aware of that. In summary, it powers up as soon as I plug it in and press the "on" switch.
As I've said before, HP manuals have always been written for the experienced tech. that doesn't really need a manual.

This is an indication of a failing power supply.
There was a discussion some time ago about a capacitor to replace in
the power supply.
IIRC this was an always on 15 Volt supply.
My take on the capacitor situation is that if one is failing replace
them all and keep the instrument working and off of the repair bench.
I have personally seen enough failed electrolytic capacitors that if
I have to replace one, I replace them all.
The cost is not that high and the others will fail soon enough.

There is no known schematic for the power supply.
I am currently reverse engineering the supply.
This is slow going as I have a lot of house maintenance to do.
When I get finished with the schematics, I will make them available
via the group.

I second Glenn's response. It is most likely a failing power supply. On one of the units that I had, it exhibited the exact same behavior before the PS finally quit.

Thanks to you and several others that responded.  Looks like I take out the power supply and start changing all the capacitors.  I seem to remember having a computer monitor that did the same thing about 10 years ago.

I did have an artical saved about the power supply but looked over it and it mentioned the green led should be on ( which mine was), but his was not on.

I have seen where I can get a rebuilt one for around $ 200 if I need it, but I am going to try replacing the capacitors.  I was in the unit a while back replacing the attuenuator from the 3 watt one to a 60 watt one.  Lots of screws...I used  battery powered drill to get most of them out..

You could also try Rick at Amtronix.  I was on his website (www.amtronix.com) this morning and he lists a rebuilt power supply for the 8920 and 8924 for $150.

I have no financial interest in Amtronix,  only saw this this morning as I was looking at his RLB.

try some different combinations of button push like left and right at the same time I can't remember how to get in the menu but I think I locked myself out of it once and thought it was bad but got back in but mine is now installed behind my bench

still no go, is that red led by IC-6 supposed to be lit ?

I have two 8220 boards here and they both have problems.

the other one works but after a hour running, the display fades to the point that it is hard to read it, I did the 8200 mod for it but did not help.
thanks

Topic: 1568  Message: 1575

sent a email to seller and he responded that if I am using the P11 input that having the vert sync it will lock me out of the menu, I disconnect the vet sync , the red and blue wires and I still have a black & white display, cannot get in the the menu and no green display
I would be ok with the black & white display if I could have a full screen centered.

I got it kinda working now.
moved to the P3 connector and reset the board, them played with the buttons, and finally got into the menu, now I have the full display but now have the fading issue, want to try the 8200 mod that used the 3 33K resistors and a 100K pot connected to the 3.2 supply, for the black background

Thanks to all that answered my question.

I called Amtronix and they shipped me a rebuilt supply right away.  Arrived in about 2 or 3 days.

After 400 screws (seemed to be that many)  I replaced the supply and now when I plug it in after being off over night, the 8924c fan starts right up and it goes to the boot up process when I first push the power switch.

I opened up the supply but decided that there were too many capacitors for me to replace as none of them showed any physical signs of being bad.  That is when I decided a rebuilt supply was just about as cheap as getting all new capacitors.

Just glad I have a battery powered screw drive.

# 1581. GBS-8220 setup

Yahoo group: hp8924
Date: 2013-07-25 23:05:33 UTC
From: wb7dmx@att.net
Topic: 1581  Message: 1581

use only P3 for input.
connect the RGB wires to listed pins
use the LM-1881 sync sep.
only pin one goes the the sync of P3.
do not use the vert sync on pin 3 of the LM1881.
then you should be able to go into the geomemtry menu to center the display.

also add the 3 33 k resistors to C29, C32, and C36 with a 100K pot center, outside leads of the pot go to R1 for the 3.2 volt reg. and the other side of the pot goes to ground,

in the photo section there is a full description and pictures of how to connect it up.

do NOT install the 50 k resistors, there not needed.

that's it.

Hi all

Just completed the attenuator mod using the H100NA20X4 flange attenuator and the 20db calibration file from the file section, just a warning for anyone that is going to try this. the attenuator needs to be fitted by grinding it down a bit, take your time grinding it down as I got mine to hot and the chip popped right of the base :( luckily I had obtained 2 parts so I took it slow the second time and all worked fine the calibration seems accurate for my purposes.

Thanks for the guide on this Upgrade

Hi
Too late for you, but if grinding these tab attenuators make sure you DO NOT GRIND THE WHITE CERAMIC material. The material between the metal mounting tab and the chip is Beryllium Oxide and is highly toxic if ground up. Google it.

Robert G8RPI.

The RF Tools program is a really nice set of tools which includes the swept return loss. Makes it a snap to determine return loss. You basically start the program and just follow the on-screen instructions and the 8924C does the rest. You can also do it manually, but it involves a lot more steps.

# 1588. Re: [hp8924] RLB

Yahoo group: hp8924
Date: 2013-07-29 15:19:26 UTC
From: Ralph Mowery
Topic: 1582  Message: 1588

Check out this youtube vidio to start with.  While the test set is not a 8924, the screens are the same.

http://www.youtube.com/watch?v=bl5Nyn85SFs

Then go to the Agilent web page and download a PDF called 8920A,B Application Handbook.pdf.  While this is for a 8920 and not the 8924,  the setup is about the same.  As most know there is very little differance in the two units.  The buttons for the controls are differant, but the screens are almost the same.

To test it, you set up the spectrum analizer  to sweep a range of frequencies  and sent the generator output to the Duplex Out.  Connect the return port to the Antenna In.  The test port goes to the device under test.  To check the RLB you need a good shorted connector and a good 50 ohm load.  You check the RL with the test port open, then shorted.  The RL should be almost the same within a db or two. The you put on the 50 ohm load and it should show zero RL.  Even the best 50 ohm load will show a small ammount of RL.  Also mentione is using some 6 DB pads between the 8924 and the RLB ports.  I don't normally do this as I can't tell any differnce for what I am doing, but I am not making critical measurmments.

There is a copy of the RF Tools program in the files section.  YOu can download it,but you will need a pcmcia card and a computer that will program it to use it.  I never can remember the name of the fellow on here that is from England, but he has a good deal on the RF Tools already on a card.

Topic: 1582  Message: 1591

Hi Ralph,
The bloke in England is me, thank you for the recomendation.
The 6dB pads HP show in the interconnection help isolate the RLB from any mismatch at the 8924 RF ports thus improving accuracy. It must be said that RF tools is only required if you are making RL meaurements. If you just want to adjust something for best match or frequency, or to check center frequency, you just need the 8924C in spectrum analyser / tracking generator mode and a RLB. In fact it is far easier to adjust circuits in this mode than using RF Tools.

Robert G8RPI.

Check out this youtube vidio to start with.  While the test set is not a 8924, the screens are the same.

http://www.youtube.com/watch?v=bl5Nyn85SFs

Then go to the Agilent web page and download a PDF called 8920A,B Application Handbook.pdf.  While this is for a 8920 and not the 8924,  the setup is about the same.  As most know there is very little differance in the two units.  The buttons for the controls are differant, but the screens are almost the same.

To test it, you set up the spectrum analizer  to sweep a range of frequencies  and sent the generator output to the Duplex Out.  Connect the return port to the Antenna In.  The test port goes to the device under test.  To check the RLB you need a good shorted connector and a good 50 ohm load.  You check the RL with the test port open, then shorted.  The RL should be almost the same within a db or two. The you put on the 50 ohm load and it should show zero RL.  Even the best 50 ohm load will show a small ammount of RL.  Also mentione is using some 6 DB pads between the 8924 and the RLB ports.  I don't normally do this as I can't tell any differnce for what I am doing, but I am not making critical measurmments.

There is a copy of the RF Tools program in the files section.  YOu can download it,but you will need a pcmcia card and a computer that will program it to use it.  I never can remember the name of the fellow on here that is from England, but he has a good deal on the RF Tools already on a card.

I knew that was you Robert, but just could not think of your name or call at the time, sorry.  Just too lazy to look over the email to find your name and call...

You have helped me get some of the RF tools loaded on a pcmcia card and I think you for it. Most of the RF tools can be setup faster and beter manually for what I do.  Adjusting the duplexers for best return loss is beter done manually as RF tools only gives you a one shot view as you mentioned.  I don't think much of RF tools for what I do, but it does have one good thing and that  is the distance to fault.

You are going to have to spend a lot of time with that 8924.  It is easy to use,but because it does so much there is a lot of learning to do.  Also the manual for it is not worth having unless you are working on the old cell phones..  It is very similar to the 8920 series and if you download the manual for it from the Agilent site you will have enough reading for a long time.  Also the I think it is the e8285 or something like that is setup very similar to it also.  There are lots of youtube vidios that use this monitor.

The best thing to do is just start it up and press buttons.  You can not harm it as long as you do not put more that about 200 miliwatts into the antenna or whatever the rated input is for the RF IN/OUT port.

If you don't know of it, go to this site for some more reading and screen shots.
http://www.amtronix.com/hp8924c60.htm

Not sure if this site is still up, but there is a vidio for the 8920 that you can download and it will give you some ideas of what you can do.  It is slightly over 1 GB large.

If changing the file extension to MP4 doesn’t work, you might need to DL it again. It should play in most any version of VLC or GOM.

Slight change of plan. Being as my webhost is not cooperating with the single large file, I removed it. In place, I added another set of smaller pieces to DL. These are from WinRAR, for those familiar with that, and should reassemble using either WinRAR or 7-Zip. Just another option to the original set that Joe created. They can be found here…
http://grovesnet.org/Downloads/

For those interested in getting it in one chunk, Jim has kindly uploaded it to his site here (and it’s working much better than mine did)…

I did download all the information you suggested and even printed some of it up, I have been reading and studying a lot while I was saving up the money to buy it. I just need more practice using it, it really is the best test gear I have ever had, and it does soo much. I think I am going to have a lot of fun with it. wish I had it 50 years ago.

I checked the data sheet and I believe these use Aluminium nitride (AlN) Quote "methods are available to allow AlN to be used in electronics applications similar to those of alumina and beryllium oxide"
I read the beryllium info and you don't want to grind that up.

I will put the data sheet in the file section

H100NA20X4
Resistive Element Thick film
Substrate ALN ceramic
Cover Alumina Ceramic
Mounting Flange Copper, Nickel plated per QQ-N-290
Lead(s): 99.99% pure silver (.006" thick)
AlN Ceramic

Not knowing any better, I just nipped the excess flange off with a pair of side cutters. As I recall, the metal seems to be copper or something close, and quite soft. The attenuator is now secured with just one screw, and I was generous with heat sink compound. So far so good.

Hi,
I'm late to this one. Low power and low attenuation units tend to be symetrical but high power and particuarly high attenuation ones generally are not. They could be made symmetrical but this would mean two high power resistors rather than one, while only one is dissapating power in a high atttenuation unit. The Anaren item is marked on the package with a dot and that lead is A on the drawing. Convention says this would be the input.

Robert G8RPI.

From: Don
Topic: 1  Message: 1607

You probably already know this, but get the manual for the HP 8920B. It has a lot more information for general RF use whereas the 8924C manual is geared towards cellular phone testing.

Take your time. It is easy to get frustrated and overwhelmed initially due to the vast capabilities of the instrument. Try to get familiar and comfortable with just a few of its capabilities initially. Later you can delve into its other capabilities.

If you find peering at the small monitor difficult, do a search for external monitor options. I have a 17" LCD monitor hooked up to my 8924C and I would never go back to using just the built in monitor.

Don

Hi all,

I have contacted Anaren regarding directionality of the attentuator.
Their reply:

"The part is directional and must have the input connected to the lead with the Dot on the lid next to it. See the datasheet for location."

Hope this helps everyone out there.

Regards,

Mark Pepping

# 1610. Re: Extending SA and TG frequency range on the 8924C

Yahoo group: hp8924
Date: 2013-08-04 13:08:16 UTC
From: Robert Atkinson
Topic: 1610  Message: 1610

Hi Don,
For SA only up to 2GHz I used a minicircuits connectorised mixer (ZEM 4300 http://217.34.103.131/pdfs/ZEM-4300+.pdf but others will do),  with the signal to RF in, and the 8924C RF output to LO and the IF out to the low level input of the 8924C. For tracking I used a separate LO signal generator with a Minicircuits splitter and two mixers, one feeding the 8924C low level input and the other fed from the tracking output. Used this to set up some GPS (1575MHz) filters and amplifiers.

I'm currently working on a more permanant version. This is based on the harmonic generator and selector from a 5254C downconverter as the LO source. The 5254C is a plugin used with early HP frequency counters to extend the range to 3GHz. The harmonic generator will be driven from the 8924C 10MHz reference output and will provide dial selectable LO up to 3GHz in 100MHz steps locked to the 8924C reference eliminating drift. I will also add input attenuation and some filtering. Lacking a 5254C a simple harmonic generator and a couple of fixed 2 and 3 GHz bandpass filters could be used.

Robert G8RPI.

---

Hi Robert,

I read with interest your recent post recommending the 8924C to someone who had asked for opinions re: an SA purchase. I was particularly intrigued by your statement that using a couple of mixers and an LO, one could extend the range of the 8924C SA and TG to 3 GHz. I have an 8924C and would very much like to try this project. Could you give me details or at least provide some links on what it entails to put this thing together? It would be great to have a block diagram and step-by-step instructions. Thanks for your time!

Don

I just completed installing a motorola mic to the 8924c, and would like to set it up to work like a ht on 146.52 simplex.
can you help me with the settings to do this ?
the reason is to check that the mic is wired correctly.

I did replace the mic element with a dynamic element.

ok, I got part of it done, what I need now is to get the rf generator to be modulated by the audio from the mic

# 1613. Re: [hp8924] Re: new user

Go to the RG Generator screen.

Set it up to generate a signal.
Set the MOD IN to FM (/Vpk)
You may or may not have to set it to the desired deviation.

The AF GEN to Audio out or off

Key the MIC so it grounds the KEY IN pin on the mic plug.  The RF Output will go from whatever you set it to to OFF when you unkey the mic.  It will go to the set output when you key the mic.

If you do not key the mic jack you will have a carrier, but no modulation.

This is not too helpful,but from the 8920 manual;To Use the MicrophoneTo modulate the RF Generator using the optional microphone (Agilent part
number 08920-61059):1. Connect the microphone to the MIC/ACC connector.2. Access the RF GENERATOR screen.3. Enter the carrier frequency in the RF Gen Freq field.4. Enter the RF Generator’s Amplitude.5. Select the Output Port (RF IN/OUT or DUPLEX OUT).6. Connect the selected output port to your receiver or antenna.7.
• select the type of modulation: Using the Mod In To field,FM (/Vpk)• enter the modulation sensitivity to a 1 Vpeak signal (usually 1 kHz for microphone
use). See “Mod In To” on page 499.8. Key the microphone to transmit.MIC/ACC Operating ConsiderationsMic In specifications
Input impedance = 100 kWMaximum input level = 10 V peak
Full scale input = 10 mV
Bandwidth is limited to 3 kHz.
The Mic In signal is filtered and amplified to provide a stable deviation-limited signal to the RF Generator.
750 ms microphone pre-emphasis is selected in the RF GENERATOR screen.

# 1614. Reading DPL or CTCSS off the air

Yahoo group: hp8924
Date: 2013-08-09 23:19:15 UTC
From: tomasguerro
Topic: 1614  Message: 1614

I followed these instructions off the air and cannot get a reading. I am new at this and was hoping for some help:

If you want to decode PL or DPL on your HP 8920A/B or HP 8924C unit, here is the setup procedure for your HP Service Monitor. By saving this procedure in memory, you can easily recall it to quickly decode off the air.

1) Press "TX Test", set the "input port" to Ant (this is for easy "off the air " decoding. If you want to use the I/O port for radios connected directly to the I/O port, you can leave the input port to I/O.
2) Go To the decoder screen ( on the 8924C, press the blue "shift" key then the "decode" key).
3) Scroll to the "mode" field and set to "CDCSS" for DPL decode. (set to "Function Gen" for CTCSS decode)
4) Scroll to "Arm measurement" field and set to "continuous".
5) Set AF analyzer in field to "FM Demod".
6) Set input level to "0.30 KHz".
7) Set Polarity field to "normal". Now, when you key a portable near the HP Service monitor, you can read DPL / PL off the air on the left side of the decoder screen. The HP Service Monitor will display several DPL codes - generally, the correct DPL code is the first one.
8) To save this screen in memory for future use,: Press blue "shift" key, then "save" key. I suggest labeling this screen to "DPL_DEC" or if using PL (CTCSS), label PL_DEC.

# 1617. Re: [hp8924] Reading DPL or CTCSS off the air

Yahoo group: hp8924
Date: 2013-08-10 17:03:36 UTC
From: Ralph Mowery
Topic: 1614  Message: 1617

I tried it on my 8924c and the directions work ok.

It may be somewhat confusing to new users. Make sure you are not getting the CDCSS and CTCSS  (subaudio tones that you want) confused.

Step 1 is just to set the input port.  Either the antenna input or the N connector on the far left.  If just holding the HT near the 8924, I would use the antenna input port.

Step 2 may be confusing.  What it means is to press the shift key (don't hold it , just a quick press and let go )then press the TX Test button again.  You will see the blue print above that key that says Decoder.

Use the round knob and go to where it says mode .  Press it in  and let it come back  out and you will see several choices.  Use the Func Gen.

Go to the Arm Mes and drop down under it and press the round knob so that CONT has the line under it.

Look at the AF ANL IN on thta screen and make sure it is set to FM Demod.  If not, set it there.

Set the input level to .30

When using the subaudio decoder you will not see the Polarity field as mentioned in step 7.  That if for the CDCSS mode.

Now key your transmitter near the antenna and you should start to see the subaudio frequency displayed while you are transmitting.

---

Now for the simple way to read the sub audio tones.

Press the  TX Test to get up the TX test screen as in step 1.  Use the round knob to get to Filter 2 and press the round knob and set it to 300Hz LPF.  The key the transmitter and read the tone frequency and deviation .

Don't forget to set it back to 15 khz or whatever you want so it will then show the normal audio deviation

Let me know if I can be of any more help.

Glad it worked for you Tom.

You can spend a lot of time with the 8924.  Think I mentioned it, but if not, go to the files section and download anything you see for the 8920.  It is almost the same unit in a slightly differant box.  The 8924 manual is almost useless unless you have some old cell phones.. Some buttons will be labled differantly and in a differant place, but they mostly work the same.  On youtube there is some info on the e8225 or something like that .  It is also similar to the 8924.

Don't be afraid to push buttons on the 8924 to see what hapens..  Unless you put too much power into the 8924, you can not hirt it.

If there is anything else I can help you  with, let me know.

# 1624. Using the HP 83236B with the 8924C

Yahoo group: hp8924
Date: 2013-08-19 22:43:00 UTC
From: Don
Topic: 1624  Message: 1624

Hi all,

I could use some help here. I am trying to get an HP 83236B PCS interface to work with my 8924C. Does the 83236B have to have a GPIB or serial connection for the internal mixers in the 83236B to work and up / downconvert signals? I don't yet have a GPIB or serial cable yet. I have the connections set up as follows:
1. The 8924C 10 MHz reference out is connected to the reference in port on the back of the 83236B
2. The 8924C duplex out port is connected to the corresponding port on the 83236B and the antenna in port on the 8924C is also connected to the corresponding port on the 83236B.
3. I am feeding a test signal at 1710 MHz into the RF in / out port on the 83236B
4. The 8924C spectrum analyzer is set to sweep between 650 and 940 MHz.

With the above set up, I don't see any signal on the 8924C spectrum analyzer. Is this the way it is supposed to work? I'm guessing that the 8924C needs to send a command to the 83236B via GPIB or serial connection to "turn on" the PCS signal generator / analyzer. Am I correct? If not, what am I doing wrong? I am not interested in actual PCS testing functionality. I would just like to downconvert 1710 to 1990 MHz signals fed into the RF in/out port on the 83236B and be able to see them on the 8924C. Also, I don't have the PCSCDMA test software. I was hoping that I could use the mixer functionality in the 83236B without having to resort to GPIB commands or software. Is this possible?

Don

# 1627. CTCSS testing anomaly

Yahoo group: hp8924
Date: 2013-08-28 23:03:02 UTC
From: Mark Pepping
Topic: 1627  Message: 1627

I have followed the Amtronix Instruments guide for setting up to decode CTCSS via a saved function.
My preference but I use "Tone Seq" for easier to read CTCSS frequency.

One thing that bothers me is the fact that after using this function, going back to RX testing, AFGen2 now shows "Send, Stop" with no way of changing this. I need to perform the POWERON reset in order to gain control again.

Any idea on getting around this?

What version of softwear does your 8924 have in it ?  I think mine is 8.01 or something like that.  I have tried to duplicate your problem, but have not been able to.

8924C has firmware A.06.33.
8920A has A.12.09.

Both machines exhibit the same symptoms.

# 1630. GBS-8200 RF Interference

Yahoo group: hp8924
Date: 2013-09-02 08:28:37 UTC
From: pepping_mark
Topic: 1630  Message: 1630

Hi all,

Have modified the GBS-8200 as per instructions here.
Initial testing was with the cables all open (non-shielded) on the bench.
As soon as I keyed a portable (hand-held) RT, the LCD display blanked out. Upon release, the display is restored to normal.

What have others done? Built the VGA adapter into an aluminium box? That's what I'm planning to do now. Hope it works.

which sync sep did you use ?
I would recommend the one I used for the gbs-8220, with the 3 33k resistors and a 100k pot.

maybe post a picture of your build would help too.

you did use coax from the composite video output to the sync separator , right ?

Sync separator: The comparator version (non LM1881).
I used 33k resistors to GND, with 50k over the top of the caps.

I didn't quite get the description of the 100k pot install. Sorry :-)

I used a Handheld RT near the circuit. I suspect that!
Haven't tried a connected RT yet.

Have others installed their GBS-8200s into cases? Plastic or alloy?
Alloy box has been purchased so will go down this route.

Of course I used a coax cable to interconnect.

Will post photo sometime soon. I am using this at work, so time permitting.

go to the photo section, look up the gbs 8200 modifications group and study the picture labled dsc01879, and read all the information there and it will cover your build.
also any rf near the 8200 will block the processor on the board, which is what your doing.
shielding is the best thing you can do.any type of cse will correct it from happening.

From: pepping_mark
Topic: 1630  Message: 1636

Had a chance yesterday to install into an aluminium case.
Works a lot better, although 'blocking' still occurs, but only with a UHF transceiver. And then only if held very close. VHF does not bother it.
Believe the RF is entering via the video cable. It is probably not the best shielded cable :-(. Had tried ferrites, also, to no avail.
Will make a short BNC-BNC cable and use the converter behind the 8924C.

I had already included the resistors, although I only added the 50k resistors, on top of the caps, for the Blue and the Green.
Yes, I added the Blue to the Green. I believe it creates a very pleasant hue to look at.

Initially only had the 33k resistors, to ground, for the Blue and Green. Found the video to fade out still.
I then added 33k resistors to the Red and Sync also. Now a normal picture is observed.

Will be so much better to use (see!!) on a larger screen.

My comment about not being able to follow the instructions were only aimed at the comment regarding a 100k pot. Not worried about it now as the system now works as expected.

Thanks all. :-)

Link doesn't appear to work. It will take you the the MPJA site, then, on the left, click on "connectors". It's the last one on that page and is $2.95 each! Sorry, don't know why the link doesn't take you to the right page.
Tom

# 1647. A long shot...

Yahoo group: hp8924
Date: 2013-09-10 01:06:56 UTC
From: Don
Topic: 1647  Message: 1647

Hi all,

I know this is a long shot, but I am hoping that someone in this group has a piece of software that I am looking for. It is the utility software that was bundled with the HP 83236B PCS interface used with the 8924C, 8920B and other test sets. There are a couple of versions that I am aware of - Rev A.02.00 and A.02.01. The part numbers are 83236-85210 and 83236-85211 for Rev A.02.00 and 83236-61001/83236-85212 for Rev. A.02.01

If any of you has this software, I would greatly appreciate it if you could upload the memory card contents to the files section (much like the RF Tools files that have been uploaded).

Don

# 1652. 8935A (8935 E6380A ) units being used - or modified?

Yahoo group: hp8924
Date: 2013-09-25 18:54:27 UTC
From: <gchafee@...>
Topic: 1652  Message: 1652

I have one of these 8935 E6380A units and have used it on and off, but was wondering if in the world of HP tinkerers, has anyone came up with any wondrous mods to either increase range or capabilities? I suspect it may use many of the same modules as eh other 8900 series service monitors, and therefore have the capacity for making it more useful.

For example, has anyone found a way to change the IF to have a more reasonable bandwidth ( right now it is 15KHZ)? A way to get it to use something like a 3kjhz, or better yet,,a DSP based programmable IF. Unfortunately, I suspect the Power-On Self Test would fail the unit if it was hardware modded. It would see the IF range is out of tolerance and fail unless there would be a way to re-write the eproms.

Any takers out there? Anyone with any cards that we could get a dump from that may be useful for activating some obscure function that could be useful for a standard Service Monitor?

I would love to find a way to get it to have full coverage from 100KHz to 2GHZ without the limit of 400KHZ on the low end and the odd break in the bands between 1GHZ and 1.7GHZ.

I know I could come up with a process to mix together signals externally and get a lower sensitivity unit, but that would take the usefulness out of what I would like to see.

How about it? Any takers?

Thanks,

Jerry

Hi Jerry,

The standard IF's in the 8935 are 30 and 230 kHz. Did you replace the receiver module with an 08920-61102 receiver to get the 15 kHz IF?

If the instrument is to be used primarily for FM (16K0F3E), the 15 kHz IF is the minimum acceptable bandwidth. For 11K0F3E, a 7.5 kHz filter is best but the 15 kHz bandwidth will do in a pinch.

The spectrum analyser coverage starts at 1400 MHz, to cover the GPS band – but I do not know whether the synthesiser coverage can be extended.

You can use an external mixer without loss of sensitivity if it is preceded by a bandpass filter and low-noise preamp. Mini-Circuits probably have suitable modules in their catalogue.

My 8935 E6380A was virtually new/unused when I acquired it, so I am very hesitant to hack into it.

Best regards,

Adam

From: Gerald Chafee
Topic: 1652  Message: 1654

Hi Adam,

I stand corrected.

I also have the 30KHz filter. My entry for 15KHz was the maximum I would wish for. Your thought of a 7.5 filter would be interesting.

I have not had access to a module to attempt to swap out, but I hope to have a second 8935 unit I might be able to play with. It would have the 30KHz filter though.

My thought is the 8935 goes though internal testing at start-up and presumably will test the IF to see if it is out of tolerance. If so, they idea may stop right there.

I may be wrong. If so, maybe there is a hack in the future to test. I am not sure if it uses a crystal filter combination, or some different way. I would think that since HP did not skimp on costs, they would go for what was best at the time.

I was told the current IF unit has some kind of jumper on it that states "30KHz or 15KHz". I am sure it is not as easy as changing a jumper.

I will let you know if I find anything.

Jerry

From: <fwbray@...>
Topic: 1652  Message: 1655

The receiver module can be replaced with the narrower bandwidth unit. The reference module can also be replaced to obtain greater stability. The total cost of replacing both modules (from Amtronix) is around $600.00.

The process is pretty easy, the most time-consuming part being removing and replacing the external and internal covers. If I recall correctly, the calibration data is automatically loaded when the receiver is changed. The reference module does require entering some data. The module I got from Amtronix came with a sheet giving the correct entries.

Hi Jerry,

As it happens, I have a duff 08920-61102 receiver module which I can open up so as to look inside. To the best of my knowledge, the module incorporates a crystal filter. I suspect that if there is a 15/30 kHz jumper, the IF filter will also need to be changed out. If this module has such a jumper, I shall post a photo in the group's "Files" section.

I am reluctant to open up the receiver module of my working 8935. Will keep you posted.

That is interesting. I wonder how much just the receiver module is. I asked Amtronix once what the cost of the High Stab option was and they had stated at the time they did not show that as user replaceable. This must have changed.

They must get enough units in they cold test a module to see if they swap out with no errors. That was my big concern.

Also I wonder if there is a way to change something where it can decode other signals such a DPL ( although that is falling out of use).

I appreciate that you have the info that the modules do indeed swap out.

I have a unit with a High Stab oscillator on the way ( that is why I am saying I have another unit for testing). I would love to get the AY5 option ( I believe that is the right number for the Rubidium Oscillator time base) but those would be few and far between. However, it would be worth it to get the narrower band receiver module if the price is right ( or get a ad unit and swap crystal filters - or whatever it uses).

I can't give you the specific reference without a lot of searching, but I do recall that there are different part numbers for the filters on the wide and narrow receiver modules. I would assume that just like other receivers, there may well be other parts -- such as resistors and capacitors -- that have different values depending upon the bandwidth.

When I bought it some months ago, the receiver module was about $400, plus shipping. Rick at Amtronix once mentioned that he had a less expensive receiver that would work. I didn't pursue that topic with him and I don't know specifically what he had in mind. It might well be worth a phone call to Rick to discuss the options and the differences.

Although I can't swear to it without pulling the covers on both my 8924 and 8935 to check the part numbers, I think that I recall that the receiver in the 8924 is the one used to convert the 8935 to the narrower IF. Assuming this to be the case, you might well be able to find a cheap used 8924 and swap the receiver. You could then part-out the 8924. You would need to verify part numbers first, but I think that my memory is correct. This might be cheaper than buying the receiver from Amtronix, but of course you would have the shipping costs for the 8924.

I don't recall whether the 8924 reference module works in the 8935. If it does and if you were to swap those, you would need to read and make note of certain latch values from the 8924 and then enter them in the 8935 after swapping the modules. If you happened to be working with a "dead" 8924 and couldn't read the values, you could still calibrate it against a GPSDO to correctly set the latch values.

If you buy the reference from Amtronix, Rick does the calibration. Just for fun, after installing the new reference in my 8935, I decided to compare the calibration to my always on GPSDO. After letting the HP 8935 warm up for about 15 minutes, the fine latch value was slightly different than what Rick provided. After another half hour, I ran the calibration again and the fine value was the same as provided by Rick. He clearly takes the time to get an accurate value. I have since checked mine a few times against the GPSDO and it is still dead on.

You might wonder why I even bothered to change the reference in light of the fact that I use a GPSDO. I did it mainly so that I could be sure that the 8935 would be accurate in the field. Also, when my garage workshop is too hot in the summer, I have been known to temporarily setup the 8935 in the house when I want to work on a radio.

Hi Jerry,

Amtronix have the high-stability reference module (08920-61192) in stock for $250. I saw Rick in Dayton last May and asked him about the receiver module; these normally go for $400. He may have some duff modules from which you may be able to create a working unit.

I purchased a 08920-61192 from a vendor in Hong Kong for $90, but have not tested it yet.

Actually there have been some 8924's from Pennsylvania that have sold around $300-$400 in working ( or close to fully working) state. The shipping is reasonable - $40 or so.

I am wondering what most people are trying to use now days as far as service monitor from this vintage. I know that an IFR will set you back some major money.

My other concern besides the fact that the 8935's have the wider bandwidths (and are kind of heavy), is they do not seem to have any kind of tools for decoding sub-audio, or digital squelch or paging options ( such as PL, DPL, etc.) although some of these are quickly becoming no longer used.

It is unfortunate that with the internal "digital CDMA" nature of the unit, that someone could not come up with a way to program it to deal with spread spectrum or even make it into a scanner /digital demodulator. I have seen where other companies have written external programs that will turn it into a "scanner" or sorts, but I am not sure how useful that is. I suspect it cannot decode trunking or (pie in the sky) Digital Trunking systems.

I will have to keep my eyes out for a used 8924. I know that there are probably a number of them where someone accidently transmitted into one with high power and fried the attenuator. Fixing a unit that was transmitted into is probably not worth it for most people and they would most likely be happy to get some money back.

You have not seen a document that gives the flow diagram with the modules for the two units have you? It would be nice to see what is interchangeable. I am surprised that someone has not come up with a mod for the 30KHz if for the 8935, unless a swap with a 8924 is the fix!!

Thanks,

Jerry

# 1663. 8924 not comming out of encode mode

Yahoo group: hp8924
Date: 2013-09-26 21:50:46 UTC
From: Ralph Mowery
Topic: 1652  Message: 1663

A while back someone asked why his 8924 would not come out of the encode mode if say he set it to send a sequence of DTMF.

To get the RX Screen to go back to where you can set it other than Start/Stop, go back to the Encode screen and change it from DTMF (if that is what you were sending)  to Function Generator.

# 1664. RE: Re: [hp8924] RE: 8935A (8935 E6380A ) units being used - or modified?

Hi Jerry,

As promised, I have taken a photo of the 08920-61102 receiver board, showing the two IGF filters FL1A and FL1B. The photo is in the VA7OJ album in the groups "Photos" section.

If you can locate a duff board, you should be able to move these filters onto the receiver board in your 8935.

Silva,

Do you did the rf diagnostics? what´s the results? I believe that a defective module is the cause of conflict: Disconnect A19 (measurementes board), then cycle the start process. Look for (maybe) a new error code. Repeat without A23 (RF Input assy).

I live in são paulo and can write direct to me.

Funny how things work out.  When you origionally posted the problem, I could not get  my 8924 to do it.  Guess that I was setting it back to the function generator before I left that screen.

The other day I was sending out a few DTMF signals to test a repeater I was working on. When I got back to the RX screen there was that problem. Took about 10 minuits to think through what I had done ands how to undo it.  Just hapened to remember someone had asked about that.

Adam,

Thanks for the picts. I wish I could figure how to save the hi res picture from the group album. It appears there would normally be a cover over the filter (I think).

I am not sure where I would find a defective 8924 receiver module, but I also wonder if a good 15KHz/280KHz receiver module could just be swapped out, or would it fail the internal self tests since the 8935 would be expecting a 30KHz bandwidth?

I am not sure if the module contains calibration information for it if you are to swap it out. I would think that changing an individual part (such as a crystal) could throw of the calibration of just that section.

Also if I were to change out the crystal, there looks to be a trimmer cap nearby, and an adjustable transformer/choke. Would these need to be adjusted or changed ( I would guess not too much)?

Maybe I can get one of the "defective" 8924C units I see on eBay and part it out. I would guess (hope) the receiver is not the most common part to go bad.

I can get an entire 8924C unit for less than buying a 15KHz/280KHz 08920-61282 receiver module from Amtronix ( although I have all good things to say about the company - just wish the prices were lower).

I would hope that someone would not swap all bad modules into a defective 8924C to get money out of it while fixing others. I am not sure it would be worth it for these companies selling older HP gear to swap out modules.

I started a new job, and hadn't done much with with these machines. The basics I do understand. It had been 'set up' in a fashion so started reading about them, and eventually got to this forum/user group.

Having had more of a play [yes whilst at work :-)], I have since changed way I check CTCSS tones.
In the TX screen, I set the audio filters to 'Filter 1' = 50Hz HPF and 'Filter 2' to 300Hz LPF. This way any modulation is not measured. Quick to change, no special set up.

I found the "stop" when I was trying to use the Decoder for 5-tone. Got back to RX screen, and saw it. Got out of Decoder mode, and all was well.
Prior to this I reset all settings, which helped although annoying, because anything that was already set up has to be entered again. A minor inconvenience.

I have also started using a microphone.
Despite people using a 'special' locking type DIN-8 connector, I used the cheaper non-locking type. I have found the socket to be quite captive, and you're never going to be far away from the unit anyway, so it becomes a moot point.
I set up the Auto switch over mode so realistic interactive testing is now automated. ie a typical transmit, listen, 'out' situation.

Funny how things work out. When you origionally posted the problem, I could not get my 8924 to do it. Guess that I was setting it back to the function generator before I left that screen.

The other day I was sending out a few DTMF signals to test a repeater I was working on. When I got back to the RX screen there was that problem. Took about 10 minuits to think through what I had done ands how to undo it. Just hapened to remember someone had asked about that.

Subject: [hp8924] RE: 8924 not comming out of encode mode

That was me, and I only figured that bit out only today!! :-) Good timing. Thanks

---In hp8924@yahoogroups.com, <hp8924@yahoogroups.com> wrote:

A while back someone asked why his 8924 would not come out of the encode mode if say he set it to send a sequence of DTMF.

To get the RX Screen to go back to where you can set it other than Start/Stop, go back to the Encode screen and change it from DTMF (if that is what you were sending) to Function Generator.

Hi Jerry,

Just sent you the hi-res photo direct. It is a 2MB file.

Good question on the 8935 identifying the IF BW. You may wish to call or e-mail Rick at Amtronix regarding this. In fact, Rick may be willing to let you have a defective module with the 15 kHz filters at a very reasonable price.

As for the ramifications of changing out the actual crystal filters, I do not know the answer. I have never seen documentation for the individual boards. The Assembly Level Repair manual E6380-90015 lists the complete modules only by reference designator and part number.

In practice, I have not found the 30 kHz IF bandwidth to be a disadvantage when using the 8935 as an FM service monitor. It is certainly a huge improvement over my ancient Cushman CE-31A (now sold.)

Subject: Re: Re: [hp8924] RE: 8935A (8935 E6380A ) units being used - or modified?

Adam,

Thanks for the picts. I wish I could figure how to save the hi res picture from the group album. It appears there would normally be a cover over the filter (I think).

I am not sure where I would find a defective 8924 receiver module, but I also wonder if a good 15KHz/280KHz receiver module could just be swapped out, or would it fail the internal self tests since the 8935 would be expecting a 30KHz bandwidth?

I am not sure if the module contains calibration information for it if you are to swap it out. I would think that changing an individual part (such as a crystal) could throw of the calibration of just that section.

Also if I were to change out the crystal, there looks to be a trimmer cap nearby, and an adjustable transformer/choke. Would these need to be adjusted or changed ( I would guess not too much)?

Maybe I can get one of the "defective" 8924C units I see on eBay and part it out. I would guess (hope) the receiver is not the most common part to go bad.

I can get an entire 8924C unit for less than buying a 15KHz/280KHz 08920-61282 receiver module from Amtronix ( although I have all good things to say about the company - just wish the prices were lower).

I would hope that someone would not swap all bad modules into a defective 8924C to get money out of it while fixing others. I am not sure it would be worth it for these companies selling older HP gear to swap out modules.

Jerry

The 8935, 8920, 8921, 8922, 8924, E8285A, etc are all very similar and if your careful, modules can be swapped from model to model. ie the spectrum analyzer from the GSM 8922 works fine in an CDMA E8285A despite having a different bandwith. Reference modules & more can be swapped. If your worried about calibration data on a module, check the block diagrams of the 8920 & 8924 assembly level repair guides. It shows which modules have cal data (ROM) along with a table showing what HP says can be swapped out without cal data. For a circuit of the receiver module 08920-61102, check the component level packet info HP released for the 8920 - pretty sure its the same or very similar to 08920-61828. As for modifying the firmware, good luck. From what I can work out its a real time operating system called PSOS by SOFTWARE COMPONENTS GROUP, INC. who I think are now defunct, sold, merged or something. There is a wiki site with info. The real problem as I see it is there are at 4 or 5 sub-systems - each has its own firmware and processor (main, DSP, cell site 1 &2 & protocol). 73s chris zl1cvd

The 8935A would be in this group where modules could be swapped around?

I do understand the issues with trying to decompile /recompile an assembly level language for the 68000 series processors. I had a laser printer that used a different assembly language and I foolishly thought I could learn enough to take the software apart. I failed miserably. I can imagine the complexity of having these different subsystems with their own little OS's running at the same time.

I suppose we should be happy that the different units were made with mostly the same type of modules, but maybe slightly different capabilities.

I don't suppose they made an AF generator with PL codes and other types of audio coding built in that would swap right in to a 8935?

Thanks,

Jerry

HI all again,

Has anyone found a software program that works on the 8935A that will make it work like a scanner? I understand there was a company that made a software program that worked on a PC and HPIB adapter that tied into a standard 8920.

I would not think it would be much of a stretch to get something that would work as a scanner , or could increase the capabilities of all of the different 8900 series by performing such things as automated testing, histograms, etc.?

Hi Gerald,
The HP 11087E opt100 "RF Tools" software includes a scanner program, but I can't confirm if it will run on the 8935A. The swept measurements are built into the 8935A. The files are in the archive if you have a suitable card. I sell programmed flash cards on ebay (item 261291816834) for 50 UK Pounds, but offere a discount for list members. You can down load the 11807 manual from the Agilent website <
http://cp.literature.agilent.com/litweb/pdf/11807-90141.pdf >

Robert G8RPI.

>>The 8935, 8920, 8921, 8922, 8924, E8285A, etc are all very similar and if your careful, modules can be swapped from model to model. ie the spectrum analyzer from the GSM 8922 works fine in an CDMA E8285A despite having a different bandwith. Reference modules & more can be swapped. If your worried about calibration data on a module, check the block diagrams of the 8920 & 8924 assembly level repair guides. It shows which modules have cal data (ROM) along with a table showing what HP says can be swapped out without cal data. For a circuit of the receiver module 08920-61102, check the component level packet info HP released for the 8920 - pretty sure its the same or very similar to 08920-61828. As for modifying the firmware, good luck. From what I can work out its a real time operating system called PSOS by SOFTWARE COMPONENTS GROUP, INC. who I think are now defunct, sold, merged or something. There is a wiki site with info. The real problem as I see it is there are at 4 or 5 sub-systems - each has its own firmware and processor (main, DSP, cell site 1 &2 & protocol). 73s chris zl1cvd

that's interesting, first, you do not have the gbs 8220 board, it is the 8200. also it is a different board made by who ?. it may have different software installed in the rom chip. also it may also be a copy of the original board.

very happy that you got yours working good.
your board is a different color, mine is red, and yours is green.
it looks like there is many different copies of this board, I did buy the original board and did not get it working right, so I sent it back and bought the one I now have.
I am surprised that yours is working with the input port your using as I am told that it will not work with a composite signal that the 8924c uses.
so it is interesting how yours is working.

the description of how I connected everything is in the photo section, and as you can see, it is totally different than yours.

Hi Bob,

In fact I have one of your HP 11807E Opt. 100 cards. The only program which will run on the 8935 is SAVRCL. The others crash with overflow errors. Is there a way around that?

Hi Gerald,

The HP 11087E opt100 "RF Tools" software includes a scanner program, but I can't confirm if it will run on the 8935A. The swept measurements are built into the 8935A. The files are in the archive if you have a suitable card. I sell programmed flash cards on ebay (item 261291816834) for 50 UK Pounds, but offere a discount for list members. You can down load the 11807 manual from the Agilent website <
http://cp.literature.agilent.com/litweb/pdf/11807-90141.pdf >

Subject: Re: RE: Re: [hp8924] RE: 8935A (8935 E6380A ) units being used - or modified?

HI all again,

Has anyone found a software program that works on the 8935A that will make it work like a scanner? I understand there was a company that made a software program that worked on a PC and HPIB adapter that tied into a standard 8920.

I would not think it would be much of a stretch to get something that would work as a scanner , or could increase the capabilities of all of the different 8900 series by performing such things as automated testing, histograms, etc.?

On Mon, Sep 30, 2013 at 2:11 PM, Gerald Chafee <gchafee@...> wrote:

The 8935A would be in this group where modules could be swapped around?

I do understand the issues with trying to decompile /recompile an assembly level language for the 68000 series processors. I had a laser printer that used a different assembly language and I foolishly thought I could learn enough to take the software apart. I failed miserably. I can imagine the complexity of having these different subsystems with their own little OS's running at the same time.

I suppose we should be happy that the different units were made with mostly the same type of modules, but maybe slightly different capabilities.

I don't suppose they made an AF generator with PL codes and other types of audio coding built in that would swap right in to a 8935?

Thanks,

Jerry

The 8935, 8920, 8921, 8922, 8924, E8285A, etc are all very similar and if your careful, modules can be swapped from model to model. ie the spectrum analyzer from the GSM 8922 works fine in an CDMA E8285A despite having a different bandwith. Reference modules & more can be swapped. If your worried about calibration data on a module, check the block diagrams of the 8920 & 8924 assembly level repair guides. It shows which modules have cal data (ROM) along with a table showing what HP says can be swapped out without cal data. For a circuit of the receiver module 08920-61102, check the component level packet info HP released for the 8920 - pretty sure its the same or very similar to 08920-61828. As for modifying the firmware, good luck. From what I can work out its a real time operating system called PSOS by SOFTWARE COMPONENTS GROUP, INC. who I think are now defunct, sold, merged or something. There is a wiki site with info. The real problem as I see it is there are at 4 or 5 sub-systems - each has its own firmware and processor (main, DSP, cell site 1 &2 & protocol). 73s chris zl1cvd

Hi Jerry,

Just sent you the hi-res photo direct. It is a 2MB file.

Good question on the 8935 identifying the IF BW. You may wish to call or e-mail Rick at Amtronix regarding this. In fact, Rick may be willing to let you have a defective module with the 15 kHz filters at a very reasonable price.

As for the ramifications of changing out the actual crystal filters, I do not know the answer. I have never seen documentation for the individual boards. The Assembly Level Repair manual E6380-90015 lists the complete modules only by reference designator and part number.

In practice, I have not found the 30 kHz IF bandwidth to be a disadvantage when using the 8935 as an FM service monitor. It is certainly a huge improvement over my ancient Cushman CE-31A (now sold.)

Subject: Re: Re: [hp8924] RE: 8935A (8935 E6380A ) units being used - or modified?

Adam,

Thanks for the picts. I wish I could figure how to save the hi res picture from the group album. It appears there would normally be a cover over the filter (I think).

I am not sure where I would find a defective 8924 receiver module, but I also wonder if a good 15KHz/280KHz receiver module could just be swapped out, or would it fail the internal self tests since the 8935 would be expecting a 30KHz bandwidth?

I am not sure if the module contains calibration information for it if you are to swap it out. I would think that changing an individual part (such as a crystal) could throw of the calibration of just that section.

Also if I were to change out the crystal, there looks to be a trimmer cap nearby, and an adjustable transformer/choke. Would these need to be adjusted or changed ( I would guess not too much)?

Maybe I can get one of the "defective" 8924C units I see on eBay and part it out. I would guess (hope) the receiver is not the most common part to go bad.

I can get an entire 8924C unit for less than buying a 15KHz/280KHz 08920-61282 receiver module from Amtronix ( although I have all good things to say about the company - just wish the prices were lower).

I would hope that someone would not swap all bad modules into a defective 8924C to get money out of it while fixing others. I am not sure it would be worth it for these companies selling older HP gear to swap out modules.

Just found the manual for the "Component Level Information Packet" and realized that pretty much all of the schematics and parts diagrams for most of the modules that would be used by any of us as a service monitor are there and in an easy to understand format.
I am thankful that the information was provided to find this manual. Although it was designed for the HP8920, as far as I can see almost all the standard modules are in this manual and available for repair to the component level as long as the person doing so has a good understanding of electronics.

I am not sure everyone has the URL for this manual, but I would highly recommend that anyone that does not have it, download it from the Agilent website.

here is the URL:

http://www.home.agilent.com/upload/cmc_upload/All/8920_Component_Level_Information_Packet.pdf

Now that I can see what is module A16 in this unit ( the receiver board), I am less sure I wish to try to finds a bad module and swap the filter parts over. The parts are easy enough ( probably changing the 2 crystals would be enough) but tuning it for the proper bandwidth shaping would be more difficult.

Hi Jerry,

Many thanks for that priceless link. I have downloaded the Packet; it is a real treasure.

You may be right as regards modifying the A16 Receiver module. After replacing A16FL1A/FL1B, you would need to sweep and realign the 10.7 MHz IF. If you have a module extender, you may be able to tune the IF by injecting white noise into ANT IN and observing FM_DEMOD_IF on a spectrum analyser.

Cheers for now,

Adam

Adam,

This is a little off from what you were asking, but I do know that at one time there was an Aussie firm creating an RF Tools program to run on a PC that would steer a HP 8920 series unit to perform what is already in the 8935 for return loss, but it also had a scanner program,

Given the settling time of this unit and the period it would take to talk back and forth to the computer, it may not be the best 'scanner' I might find, but if there is access to the power of a PC, I could theoretically get the capability to scan and possibly decode signals? Maybe it could be fast enough to follow spread spectrum (or at least trunking, but maybe not decode digital trunking).

I can see the case for having a computer take the output and give waterfall histograms of the spectrum analyzer, and many other possibilities. This could probably be done with standard programming, but not sure how fast the system really would respond. I am sure the latency on the HPIB would cause grief.
I used to program the really old HP 9825 computers/calculators to perform instrument control, but it was really slow going ( bothe for programming and for program operation).

What do you think? Have you ever heard of anyone writing programs for the HP8900 series units to do special stuff with an external computer?

Thanks,

Jerry

Adam,

This is a little off from what you were asking, but I do know that at one time there was an Aussie firm creating an RF Tools program to run on a PC that would steer a HP 8920 series unit to perform what is already in the 8935 for return loss, but it also had a scanner program,

Given the settling time of this unit and the period it would take to talk back and forth to the computer, it may not be the best 'scanner' I might find, but if there is access to the power of a PC, I could theoretically get the capability to scan and possibly decode signals? Maybe it could be fast enough to follow spread spectrum (or at least trunking, but maybe not decode digital trunking).

I can see the case for having a computer take the output and give waterfall histograms of the spectrum analyzer, and many other possibilities. This could probably be done with standard programming, but not sure how fast the system really would respond. I am sure the latency on the HPIB would cause grief.

I used to program the really old HP 9825 computers/calculators to perform instrument control, but it was really slow going ( bothe for programming and for program operation).

What do you think? Have you ever heard of anyone writing programs for the HP8900 series units to do special stuff with an external computer?

Thanks,

Jerry

Hi Gerald,
The HP 11087E opt100 "RF Tools" software includes a scanner program, but I can't confirm if it will run on the 8935A. The swept measurements are built into the 8935A. The files are in the archive if you have a suitable card. I sell programmed flash cards on ebay (item 261291816834) for 50 UK Pounds, but offere a discount for list members. You can down load the 11807 manual from the Agilent website <
http://cp.literature.agilent.com/litweb/pdf/11807-90141.pdf >

HI all again,

Has anyone found a software program that works on the 8935A that will make it work like a scanner? I understand there was a company that made a software program that worked on a PC and HPIB adapter that tied into a standard 8920.

I would not think it would be much of a stretch to get something that would work as a scanner , or could increase the capabilities of all of the different 8900 series by performing such things as automated testing, histograms, etc.?

On Mon, Sep 30, 2013 at 2:11 PM, Gerald Chafee <gchafee@...> wrote:

The 8935A would be in this group where modules could be swapped around?

I do understand the issues with trying to decompile /recompile an assembly level language for the 68000 series processors. I had a laser printer that used a different assembly language and I foolishly thought I could learn enough to take the software apart. I failed miserably. I can imagine the complexity of having these different subsystems with their own little OS's running at the same time.

I suppose we should be happy that the different units were made with mostly the same type of modules, but maybe slightly different capabilities.

I don't suppose they made an AF generator with PL codes and other types of audio coding built in that would swap right in to a 8935?

Thanks,

Jerry

The 8935, 8920, 8921, 8922, 8924, E8285A, etc are all very similar and if your careful, modules can be swapped from model to model. ie the spectrum analyzer from the GSM 8922 works fine in an CDMA E8285A despite having a different bandwith. Reference modules & more can be swapped. If your worried about calibration data on a module, check the block diagrams of the 8920 & 8924 assembly level repair guides. It shows which modules have cal data (ROM) along with a table showing what HP says can be swapped out without cal data. For a circuit of the receiver module 08920-61102, check the component level packet info HP released for the 8920 - pretty sure its the same or very similar to 08920-61828. As for

modifying the firmware, good luck. From what I can work out its a real time operating system called PSOS by SOFTWARE COMPONENTS GROUP, INC. who I think are now defunct, sold, merged or something. There is a wiki site with info. The real problem as I see it is there are at 4 or 5 sub-systems - each has its own firmware and processor (main, DSP, cell site 1 &2 & protocol). 73s chris zl1cvd

Hi Jerry,

Just sent you the hi-res photo direct. It is a 2MB file.

Good question on the 8935 identifying the IF BW. You may wish to call or e-mail Rick at Amtronix regarding this. In fact, Rick may be willing to let you have a defective module with the 15 kHz filters at a very reasonable price.

As for the ramifications of changing out the actual crystal filters, I do not know the answer. I have never seen documentation for the individual boards. The Assembly Level Repair manual E6380-90015 lists the complete modules only by reference designator and part number.

In practice, I have not found the 30 kHz IF bandwidth to be a disadvantage when using the 8935 as an FM service monitor. It is certainly a huge improvement over my ancient Cushman CE-31A (now sold.)

Subject: Re: Re: [hp8924] RE: 8935A (8935 E6380A ) units being used - or modified?

Adam,

Thanks for the picts. I wish I could figure how to save the hi res picture from the group album. It appears there would normally be a cover over the filter (I think).

I am not sure where I would find a defective 8924 receiver module, but I also wonder if a good 15KHz/280KHz receiver module could just be swapped out, or would it fail the internal self tests since the 8935 would be expecting a 30KHz bandwidth?

I am not sure if the module contains calibration information for it if you are to swap it out. I would think that changing an individual part (such as a crystal) could throw of the calibration of just that section.

Also if I were to change out the crystal, there looks to be a trimmer cap nearby, and an adjustable transformer/choke. Would these need to be adjusted or changed ( I would guess not too much)?

Maybe I can get one of the "defective" 8924C units I see on eBay and part it out. I would guess (hope) the receiver is not the most common part to go bad.

I can get an entire 8924C unit for less than buying a 15KHz/280KHz 08920-61282 receiver module from Amtronix ( although I have all good things to say about the company - just wish the prices were lower).

I would hope that someone would not swap all bad modules into a defective 8924C to get money out of it while fixing others. I am not sure it would be worth it for these companies selling older HP gear to swap out modules.

Hi Jerry,

I see that the external RF Tools program is rather expensive.

I use an external program (PrintCapture) in my laptop to capture screen images off the 8935. It works quite well, but is not real-time. An example of its usage is here:

http://www.ab4oj.com/atu/presel/main.html

For real-time signal evaluation, I have an HP 8563E. As I have no requirement for a scanner, I have not pursued that particular line of investigation. There is a scanner program in the 11807E Opt. 100 suite, but it will not run on the 8935. Perhaps it runs on the 8924C.

# 1689. HP 8935A Service Monitors Spectrum Analyzer extended range in firmware?

Yahoo group: hp8924
Date: 2013-10-30 21:37:50 UTC
From: <gchafee@...>
Topic: 1689  Message: 1689

Hi all,

I have been going over a number of bits of older data regarding the HP 8935A's earlier firmware revisions, when I noticed this little item in the A.02.00 firmware:

Agilent 8935 Series E6380A CDMA Base Station Test Set Firmware Enhancements Update

A.02.00 Release Enhancements, February 1999

1.4 GHz Spectrum analyzer frequency extension

Allows you to monitor intermittent/interfering signals at GPS frequencies with the spectrum analyzer. Service providers have found that spectral clearing at GPS frequencies is imperative to CDMA system timing and ultimately network interoperability. Monitoring and spectral clearing at GPS frequencies can help prevent the "island cell effect."

This would appear to indicate the spectrum analyzers ( and therefore the main receivers they are based on ) had extended frequency capabilities beyond the 400KHz to 1GHz and 1.7GHz to 2.0 GHz.

These use the same receivers for the different 8935A and 8286 series, but the 8920's and other related may not have that capability unless they had the downconverter as I would guess this is an extension of the 1.7 to 2.0GHz system.

Does anyone know if the receivers and spectrum analyzers can go down to the 1.4GHz frequency range? I know it would be really nice if the internal converter could make these work from 400KHz to 2GHz with no interruptions ( except probably generate would not work).

Anyone ever see this?

Also anyone ever find if the AF analyzer from a 8920 or 8921 was swapped out for the one in the 8935, if it could then decode radio paging (and the limited trunking decoding from EDACS and other info)? It seems the 8935 is an expanded 8920, but has limited analog decoding.

It would be nice to find a way to turn the quadrature decoding mixers in the CDMA system to use for other non-standard communications protocols. I see the I and Q phase shifted data available on both generate ( transmit) and receive, but probably tinkering with it would end up with a really big brick! It does look like the basics for the first types of SDR radios ( however, this is just to manage signals from the IF).

Jerry

I assume you're talking about the "brightness" setting on the RF ANL screen?
There's also a pot. (adjustment) on the top of the display module that sets the range of adjustment available from the front panel. It should be set so that you can't turn the brightness down too low from that front panel adjustment. Remove the top cover and adjust that pot so that you just barely see the display when the front panel adjustment is all the way down. Then adjust at the front panel for desired brightness. IF I REMEMBER CORRECTLY the brightness pot. is the third one back from the front of the display BUT BEFORE YOU ADJUST any pot. maybe someone else can confirm that position so you don't get the wrong one. Sorry, its just been too long to remember for sure. Hope this helps.
Tom

Don't you just hate it when a display goes blank on you...

Look at the blue SHIFT button near the lower left ot them.  Press it once and then goto the top row where you will see a button lables TESTS and blue lableing behind it labled CONFIG.  Press it once.  That should take you to the configuration screen.  Turn the knob 8 clicks and you will be at the brightness adjustment.  Press the knob once and turn it to the right.  You should then start to see the brightness of the screen.

Another easier way is to Press SHIFT then TESTS (CONFIG in blue ) and then press the K5 key that is above the Blue SHIFT key.  Do NOT press the round knob in,but turn it to the right several clicks to adjust the brightness.

The K5 key when on the configuration screen will take you directly to the brightness setting and highlight it.  Then all you need to do is just turn the knob without pressing it in.  When you can see the screen and have it set, you can then press the knob in.

Hi Tom, yes it was the adjustment in the config screen, that the settings go up to 8. It was dim and just a few down it went black. Maybe I have other issues but the screen is ok on power up but once it finishes the test phase it goes black. I will look through the book and see it the pots are labeled, but that is a good place to start, thank you, Craig

Subject: [hp8924] Re: Need Help

I assume you're talking about the "brightness" setting on the RF ANL screen?
There's also a pot. (adjustment) on the top of the display module that sets the range of adjustment available from the front panel. It should be set so that you can't turn the brightness down too low from that front panel adjustment. Remove the top cover and adjust that pot so that you just barely see the display when the front panel adjustment is all the way down. Then adjust at the front panel for desired brightness. IF I REMEMBER CORRECTLY the brightness pot. is the third one back from the front of the display BUT BEFORE YOU ADJUST any pot. maybe someone else can confirm that position so you don't get the wrong one. Sorry, its just been too long to remember for sure. Hope this helps.

Hi Ralph I tried that no luck however. Maybe some other issue but doesn't seem like it should be as it went out as I turned it down. I wonder if I should try to see if the range pot will help.

---In hp8924@yahoogroups.com, <hp8924@yahoogroups.com> wrote:

Another easier way is to Press SHIFT then TESTS (CONFIG in blue ) and then press the K5 key that is above the Blue SHIFT key. Do NOT press the round knob in,but turn it to the right several clicks to adjust the brightness.

The K5 key when on the configuration screen will take you directly to the brightness setting and highlight it. Then all you need to do is just turn the knob without pressing it in. When you can see the screen and have it set, you can then press the knob in.

Don't you just hate it when a display goes blank on you...

Look at the blue SHIFT button near the lower left ot them. Press it once and then goto the top row where you will see a button lables TESTS and blue lableing behind it labled CONFIG. Press it once. That should take you to the configuration screen. Turn the knob 8 clicks and you will be at the brightness adjustment. Press the knob once and turn it to the right. You should then start to see the brightness of the screen.

Hi Craig,
That pot. apparently has a tendency to go intermittent and can be troublesome at times. You may need to rotate the control back and forth a few times to get it to be consistent. I've been tempted to try a very small amount of DeOxit to see if that helps as I'm told that the correct pot. is no longer available. I guess there is a replacement but it requires some creative bending of the leads to make it fit (physically). If you want the best fix available, last I knew, Amtronix had some brand new monitor modules which don't have that problem but, for me at least, they're a bit pricey. Keep us posted.

If you can't see the screen you can't get to the menus!!! The only alternative is to connect a video converter and use a VGA monitor.

Most of the screens will go back to a power on state or you can set them up and save them using the POWERON command and most will come up that way.

The configuration screen will not do that.  Whever you have it set, it will come back up that way when you turn off the power and turn it back on.

As far as I know you can open it up and adjust the pot as mentioned, or follow the steps I gave and hope that you hit the number of steps correctly.  I think the shift, tests, K5 sequence should be easy to do.  It beats opening the case and what seems like 500 screws to do that.

I have had mine open twice.  Once to change the attenuator pad to make it a 60 watt unit and another time to replace the power supply.  I used a power screwdriver both times to get the screws out and in.  The are the torx (however you spell it) type of screws also.

# 1700. Re: [hp8924] HP 8935A Service Monitors Spectrum Analyzer extended range in firmware?

Yahoo group: hp8924
Date: 2013-11-04 16:07:09 UTC
From: Gerald Chafee
Topic: 1689  Message: 1700

Hello Everyone on this forum,

Did my post not generate any interest?

If there really was a way in firmware to extend the receiver to 1.4GHz, who is to say they did not have the capacity to extend the range ( maybe in an uncal mode) to 1GHz? If so, one of these units would cover 400KHz to 2GHz with no interruptions, except to make the jump at 1GHz where the upconverter/downconverter would swap.

Any comments?

"As far as I know you can open it up and adjust the pot as mentioned, or follow the steps I gave and hope that you hit the number of steps correctly."

Ralph,
Based on what he has described, he's going to have to open it up to clean (or replace) and readjust that pot.; its NOT going to fix itself! AND, by turning the pot. all the way up, he will see the display, even with the "config" set all the way down. I know that because, when I bought my 8924, that's the way it came. The pot. was set way too high and the "config" setting was on "1" and the display was brighter than I normally use it, so..... bite the bullet and FIX it once and for all! (I can preach about it but I still haven't replaced the pot. in mine either!) But that's mainly because I want to try a few cleaners on it first to see if simething will effect a semi-permanent repair since the correct pot. is supposedly no longer available. I just don't like trying to "mickey-mouse" something that really doesn't fit correctly.

# 1704. Re: [hp8924] HP 8935A Service Monitors Spectrum Analyzer extended range in firmware?

Yahoo group: hp8924
Date: 2013-11-04 22:18:41 UTC
From: Gerald Chafee
Topic: 1689  Message: 1704

Yes - unfortunately, my 8935A has firmware version A01.10 (which is probably what most people have). I have no way of testing or finding if this was all in firmware. According to the manuals I can find, there is no special setup for firmware A02.00. I guess you just need to have the firmware files. I am not sure where to find these files.

The spectrum analyzer runs off the same IF that feeds the receiver (114.3MHz), so that could not be changed as all the 89XX series use the same basic receiver modules ( with a minor change for one bandwidth).

The 8935A block diagrams show the downconverter having a range of 1400MHz - 2200MHz.right from the antenna (or RFIn/Out). So this would leave it up to the LO to generate a frequency between 1014 and 1814 which would extend the receive frequency range from 1400MHz to 2200MHz. That is a big jump as it adds 500MHz to the receive range.

It is not a matter of making any mods to the system, it was designed with these specs in the RF section ( see Assembly Level Repair manual E6380-90015 (Rev E) page 288).

The question is why does it not work already through this range as it was clearly designed to do so? Did HP cripple it on purpose to make it so they could add "frequency extension options" in the future?

The only other reason I can think if where thy did not wish to publish this fact, is that the Generate portion did not have the capability to match this range.

So if that is it, the issue is the RX and TX ranges would be different and may cause some confusion to someone that should have no business working on radio equipment in the first place if they did not understand this.

Any additional help here guys?

Jerry

Joe,
If you have any information we haven't considered, I, for one, would sure like to hear it as well. As my comment should have implied, I'm not really happy with any of the options I've considered. All help is greatly appreciated.
Tom

Tom I think as someone else had suggested you can take the covers off and adjust the brightness pot. Mine was noisy so I cleaned it then adjusted it so at min front panel brightness you can still see a trace.

Ok I opened it up and adjusted the pot and display came back nice and bright! I adjusted the low end to be still visible but good at 4 or 5. Really excited! Thank you all for the help, it is far better now than when I received it. Awesome!!!! By the way the pot did not seem flakey at all and adjusted very solid. Pretty dusty so blew it out well with air so that should help the cooling.

# 1710. RE: [hp8924] HP 8935A Service Monitors Spectrum Analyzer extended range in firmware?

Yahoo group: hp8924
Date: 2013-11-05 02:40:04 UTC
From: Adam Farson
Topic: 1689  Message: 1710
Attachments: 1 described; binary payloads are missing from this source WARC

Hi Tim,

My 8935 is a late model (S/N prefix GB41) and the firmware version is B.04.00. Its spectrum analyser tunes down t0 1400 MHz.

A non-invasive method for 1.2 GHz operation is an external mixer/LO. One could derive a 200 MHz LO signal by phase-locking a Mini-Circuits VCO to one of the clock outputs from the 8935. A 1.2 GHz bandpass filter at the mixer’s RF port would keep down spurious outputs/responses (e.g. the opposite sideband of the mix.)

73, Adam VA7OJ/AB4OJ

I'd love this to be possible so I can work on stuff at 1296.

I'll be watching this thread with interest :)

Cheers

Tim

Hello Everyone on this forum,

Did my post not generate any interest?

If there really was a way in firmware to extend the receiver to 1.4GHz, who is to say they did not have the capacity to extend the range ( maybe in an uncal mode) to 1GHz? If so, one of these units would cover 400KHz to 2GHz with no interruptions, except to make the jump at 1GHz where the upconverter/downconverter would swap.

Any comments?

On Wed, Oct 30, 2013 at 5:37 PM, <gchafee@...> wrote:

Hi all,

I have been going over a number of bits of older data regarding the HP 8935A's earlier firmware revisions, when I noticed this little item in the A.02.00 firmware:

Agilent 8935 Series E6380A CDMA Base Station Test Set Firmware Enhancements Update

A.02.00 Release Enhancements, February 1999

1.4 GHz Spectrum analyzer frequency extension

Allows you to monitor intermittent/interfering signals at GPS frequencies with the spectrum analyzer. Service providers have found that spectral clearing at GPS frequencies is imperative to CDMA system timing and ultimately network interoperability. Monitoring and spectral clearing at GPS frequencies can help prevent the "island cell effect."

This would appear to indicate the spectrum analyzers ( and therefore the main receivers they are based on ) had extended frequency capabilities beyond the 400KHz to 1GHz and 1.7GHz to 2.0 GHz.

These use the same receivers for the different 8935A and 8286 series, but the 8920's and other related may not have that capability unless they had the downconverter as I would guess this is an extension of the 1.7 to 2.0GHz system.

Does anyone know if the receivers and spectrum analyzers can go down to the 1.4GHz frequency range? I know it would be really nice if the internal converter could make these work from 400KHz to 2GHz with no interruptions ( except probably generate would not work).

Anyone ever see this?

Also anyone ever find if the AF analyzer from a 8920 or 8921 was swapped out for the one in the 8935, if it could then decode radio paging (and the limited trunking decoding from EDACS and other info)? It seems the 8935 is an expanded 8920, but has limited analog decoding.

It would be nice to find a way to turn the quadrature decoding mixers in the CDMA system to use for other non-standard communications protocols. I see the I and Q phase shifted data available on both generate ( transmit) and receive, but probably tinkering with it would end up with a really big brick! It does look like the basics for the first types of SDR radios ( however, this is just to manage signals from the IF).

Jerry

Hi,
it's easy, connect a coax jumper between the 10MHz oven output and the Reference input.

Hi,

it's easy, connect a coax jumper between the 10MHz oven output and the Reference input.

Oh I have one more question, it is set up to use external reference at 10 MHz and works with 10 MHz from my IFR. How do I change it to use internal reference signal?

Tom I think as someone else had suggested you can take the covers off and adjust the brightness pot. Mine was noisy so I cleaned it then adjusted it so at min front panel brightness you can still see a trace.

Adam,

Is yours a E6380A (CDMA) or E6381A (TDMA)

Does the receiver and receiver measurements work from 1400MHZ to 2000MHZ?

Since this is all comes from the same IF, it would seem logical it would
allow other measurements then just the Spectrum Analyzer.

Too bad there is not an easy way to hack the firmware as it should be able
to go from 1400MHZ to 2200MHZ through the entire receive/analyzer train.

Any ideas how to get the newer firmware to upgrade the older version?

# 1714. RE: [hp8924] HP 8935A Service Monitors Spectrum Analyzer extended range in firmware?

Yahoo group: hp8924
Date: 2013-11-05 19:49:27 UTC
From: Adam Farson
Topic: 1689  Message: 1714
Attachments: 1 described; binary payloads are missing from this source WARC

Hi Jerry,

My 8935 is an E6380A (CDMA). I checked the receiver (RF Analyser) and it covers only 0.4 - 1000 MHz and 1700-2000 MHz. I was able to "stretch" the RF Generator to 1015 MHz but it rejected entries > 1015 MHz.

I did a search on the firmware, but no go. About the only place I can think of which may have it is an HP/Agilent calibration centre. You could try Rick Bowman at Amtronix Instruments.

http://www.amtronix.com

Cheers for now,

Adam

Hi Tim,

My 8935 is a late model (S/N prefix GB41) and the firmware version is B.04.00. Its spectrum analyser tunes down t0 1400 MHz.

A non-invasive method for 1.2 GHz operation is an external mixer/LO. One could derive a 200 MHz LO signal by phase-locking a Mini-Circuits VCO to one of the clock outputs from the 8935. A 1.2 GHz bandpass filter at the mixer's RF port would keep down spurious outputs/responses (e.g. the opposite sideband of the mix.)

If so, one of these units would cover 400KHz to 2GHz with no interruptions, except to make the jump at 1GHz where the upconverter/downconverter would swap.

Any comments?

On Wed, Oct 30, 2013 at 5:37 PM, <gchafee@...> wrote:

Hi all,

I have been going over a number of bits of older data regarding the HP 8935A's earlier firmware revisions, when I noticed this little item in the A.02.00 firmware:

Agilent 8935 Series E6380A CDMA Base Station Test Set Firmware Enhancements Update

A.02.00 Release Enhancements, February 1999

1.4 GHz Spectrum analyzer frequency extension

Allows you to monitor intermittent/interfering signals at GPS frequencies with the spectrum analyzer. Service providers have found that spectral

clearing at GPS frequencies is imperative to CDMA system timing and ultimately network interoperability. Monitoring and spectral clearing at GPS frequencies can help prevent the "island cell effect."

This would appear to indicate the spectrum analyzers ( and therefore the main receivers they are based on ) had extended frequency capabilities beyond the 400KHz to 1GHz and 1.7GHz to 2.0 GHz.

These use the same receivers for the different 8935A and 8286 series, but the 8920's and other related may not have that capability unless they had the downconverter as I would guess this is an extension of the 1.7 to 2.0GHz system.

Does anyone know if the receivers and spectrum analyzers can go down to the 1.4GHz frequency range? I know it would be really nice if the internal converter could make these work from 400KHz to 2GHz with no interruptions ( except probably generate would not work).

Anyone ever see this?

Also anyone ever find if the AF analyzer from a 8920 or 8921 was swapped out for the one in the 8935, if it could then decode radio paging (and the limited trunking decoding from EDACS and other info)? It seems the 8935 is an expanded 8920, but has limited analog decoding.

It would be nice to find a way to turn the quadrature decoding mixers in the CDMA system to use for other non-standard communications protocols. I see the I and Q phase shifted data available on both generate ( transmit) and receive, but probably tinkering with it would end up with a really big brick! It does look like the basics for the first types of SDR radios ( however, this is just to manage signals from the IF).

Jerry

Yes - I expect that generating will not go past the original specs looking at the block diagrams, but the receive diagrams show a range in the high end of 1400 MHz - 2200 MHz

I have a feeling that updated firmware is going to be difficult to find.

From: Gerald Chafee
Topic: 1689  Message: 1716

I tried to send off an email to Amtronix and it bounced as their email quota exceeded.

I will give them a try as far as calling ( they are in the same State as I am and not too far away in distance).

Maybe I can get lucky.

Hi Jerry,

Calling them is probably best; ask for Rick Bowman. He is a great guy and very willing to help.

I did another thorough search for firmware. Even searched eBay; they have other firmware on offer, including a set for the 8920A - but nothing for the 8935.

It looks as if I was very lucky to "snag" such a late-model instrument. Have you checked with a couple of calibration houses?

73, Adam VA7OJ/AB4OJ

I did a search on the firmware, but no go. About the only place I can think of which may have it is an HP/Agilent calibration centre. You could try Rick Bowman at Amtronix Instruments.

http://www.amtronix.com

Cheers for now,

Adam

Adam,

Is yours a E6380A (CDMA) or E6381A (TDMA)

Does the receiver and receiver measurements work from 1400MHZ to 2000MHZ?

Since this is all comes from the same IF, it would seem logical it would allow other measurements then just the Spectrum Analyzer.

Too bad there is not an easy way to hack the firmware as it should be able to go from 1400MHZ to 2200MHZ through the entire receive/analyzer train.

Any ideas how to get the newer firmware to upgrade the older version?

Jerry

Hi Tim,

My 8935 is a late model (S/N prefix GB41) and the firmware version is B.04.00. Its spectrum analyser tunes down t0 1400 MHz.

A non-invasive method for 1.2 GHz operation is an external mixer/LO. One could derive a 200 MHz LO signal by phase-locking a Mini-Circuits VCO to one of the clock outputs from the 8935. A 1.2 GHz bandpass filter at the mixer's RF port would keep down spurious outputs/responses (e.g. the opposite sideband of the mix.)

Did my post not generate any interest?

If there really was a way in firmware to extend the receiver to 1.4GHz, who is to say they did not have the capacity to extend the range ( maybe in an uncal mode) to 1GHz? If so, one of these units would cover 400KHz to 2GHz with no interruptions, except to make the jump at 1GHz where the upconverter/downconverter would swap.

Any comments?

On Wed, Oct 30, 2013 at 5:37 PM, <gchafee@...> wrote:

Hi all,

I have been going over a number of bits of older data regarding the HP 8935A's earlier firmware revisions, when I noticed this little item in the A.02.00 firmware:

Agilent 8935 Series E6380A CDMA Base Station Test Set Firmware Enhancements Update

A.02.00 Release Enhancements, February 1999

1.4 GHz Spectrum analyzer frequency extension

Allows you to monitor intermittent/interfering signals at GPS frequencies with the spectrum analyzer. Service providers have found that spectral clearing at GPS frequencies is imperative to CDMA system timing and ultimately network interoperability. Monitoring and spectral clearing at GPS frequencies can help prevent the "island cell effect."

This would appear to indicate the spectrum analyzers ( and therefore the main receivers they are based on ) had extended frequency capabilities beyond the 400KHz to 1GHz and 1.7GHz to 2.0 GHz.

These use the same receivers for the different 8935A and 8286 series, but the 8920's and other related may not have that capability unless they had the downconverter as I would guess this is an extension of the 1.7 to 2.0GHz system.

Does anyone know if the receivers and spectrum analyzers can go down to the 1.4GHz frequency range? I know it would be really nice if the internal converter could make these work from 400KHz to 2GHz with no interruptions ( except probably generate would not work).

Anyone ever see this?

Also anyone ever find if the AF analyzer from a 8920 or 8921 was swapped out for the one in the 8935, if it could then decode radio paging (and the limited trunking decoding from EDACS and other info)? It seems the 8935 is an expanded 8920, but has limited analog decoding.

It would be nice to find a way to turn the quadrature decoding mixers in the CDMA system to use for other non-standard communications protocols. I see the I and Q phase shifted data available on both generate ( transmit) and receive, but probably tinkering with it would end up with a really big brick! It does look like the basics for the first types of SDR radios ( however, this is just to manage signals from the IF).

# 1718. Stream ads in the Yahoo user group's conversation area!

Yahoo group: hp8924
Date: 2013-11-09 19:59:50 UTC
From: <alexschwarz237@...>
Topic: 1718  Message: 1718

Hi Everybody;

Yahoo decided to place stream ads into the "Conversation" section. This is highly confusing and misleading.

Please go to this link and voice your displeasure with this method of false advertising.
https://yahoo.uservoice.com/forums/209451-us-groups/suggestions/4496568-stop-putting-advertisements-in-my-group-message-fe?tracking_code=1c51fcf3e994851572b6142e806aef73 https://yahoo.uservoice.com/forums/209451-us-groups/suggestions/4496568-stop-putting-advertisements-in-my-group-message-fe?tracking_code=1c51fcf3e994851572b6142e806aef73
Also, can you please go to this link and tell Yahoo what you think about the ads in the “conversation” section.
You can further go to:
https://yahoo.uservoice.com/forums/209451-us-groups/filters/hot
https://yahoo.uservoice.com/forums/209451-us-groups/filters/hot
And tell Yahoo what you think and you can also vote to keep Yahoo a pleasant experience and knowledge base, without ads.
If you are a administrator of a group please forward this message to all users in other groups you administer.
Thank you;

I don't see any ads. Perhaps its because I'm using AdBlock? Seems to me that that's a lot easier than arguing with yahoo where you'll have a snowball's chance in h*** to get any results. Its been my experience that yahoo could care less what their users think.

Topic: 1718  Message: 1722

HI Everybody;

I have found a way to block the annoying ads on the Yahoo site altogether, but it only works if you use Firefox. I recommend that everybody upgrades to Firefox anyways. There is an add on called Adblock Plus that can be installed onto Firefox and all the ads will not be downloaded to your computer. This is great, because all the adverts take up bandwidth.

If you already use Firefox here is the link to Adblock Plus:https://addons.mozilla.org/en-US/firefox/addon/adblock-plus/
https://addons.mozilla.org/en-US/firefox/addon/adblock-plus/
https://addons.mozilla.org/en-US/firefox/addon/adblock-plus/
Never be bothered by inappropriate and annoying ads that waste your internet speed and can become costly if you are past your data limit.

Hi Adam,

Just got back from holidays and checked the firmware in my 8935 and its
the same as yours. It has the same range too.

I bought mine from Amtronix and had it calibrated by Rick prior to
shipment.

I had asked Rick previously about range extension but he had no answers
at that time.

regards

Tim

# 1726. false spurs on spectrum analizer

Yahoo group: hp8924
Date: 2013-11-19 00:45:42 UTC
From: <ku4pt@...>
Topic: 1726  Message: 1726

I was playing around with a transmiitter going into a dummy load . The dummy load has a tap that is about 40 db down at 150 mhz. Going into the power input port and sweeping from 30 to 1000 mhz I noticed about 8or 10 spurs that would show up if I moved the atuenuator on the 8924c up and down. If I only swep 100 or 200 mhz the spurs did not show up. I am not overloading the 8924 as the main signal is still two major devisions below the top of the screen. The spurs show up almost as much.

Going into the antenna p;ort shows up the same.

Has anyone else noticed that sweeping a large range will show spurs,but without changing a thing other than the sweep the spurs seem to dissapear.

If you are changing the attenuator setting the main signal amplitude may be topping out. This can happen if the attenuator logic momentarily switches out attenuation stages. As the Dr said if it hurts don't do it.

Topic: 1726  Message: 1729

I think I have found the problem.  I was over driving the SA but did not think I was.  I know over driving the SA will produce a screen similar to what I was seeing.

Comming out of a transmitter at 146 mhz with 80 watts going into a dummy load that has a tap of about 50 db and going into the 8924c.  My 8924c will take 60 watts on the power in port.

The tracking generator is cut off for the tests.

I have found that if I set the center frequency to 500 mhz and a span of 1000 mhz the SA screen just shows a small signal just out of the 'grass'.  If I set it for a center of 499 mhz with the same span, the screen shows a signal that goes off the top of the screen unless I change the atteunator  setting on the 8924c.  It also works for other combinations such as 400 and 800 mhz.  If I use 399 and 800 it works normally.

That explains the 'phantom spurs'.  For whatever reason I can not set the center frequency to exectally half of the span and get a true display. If I set it just a very small offset the signal gets larger but still not full value, but it takes about 1 mhz to eliminate the problem. I guess it is one of the quarks of the instrument.  I have dealt with instruments of all kinds enough to not let this bother me as they all seem to have them, it is just finding them and knowing how to deal with them.

Now that I have the phantom spurs solved, I can see the harmonics of the transmitte which are way down where they should be.

If you see my comments on another posting you may try that.  Set you span to exectally two times the center frequency and put in a signal .  Then without changing anything change the center frequency about 1 or 2 mhz lower and see if the signal level shows a change.

That is set the center to 500 mhz and a span to 1000.  Input a signal of 150 mhz and look at the level on the screen.  Then set the center frequency to 499mhz and look at the signal level.  You can also try this with a center of 400 and 800 mhz.

Seems to be a quark on my 8924c that I can not set the span exectally two times the center frequency and get accurate results.

I tried this on my 8935 (E6380A), using 500 MHz centre frequency and 1 GHz span. The signal source was the instrument's internal signal generator, with tracking off, f0 = 500 MHz and level = -26 dBm. RF Gen output was RF Out, and SA input was RF In (loopback).

With Ref Level on the spectrum analyser at 10 dBm, I saw a baseline (grass) with the f0 = 500 MHz spike in the centre and the zero-frequency spike on the left. There were no spurs.

I think I have gotten to the bottom of that problem, but noticed something else during the process.

I was using the AVG function and had it set to 1. This was to smooth out the traces. While the SA was set to sweep 400 mhz and the center set to 200, I used an external old analog signal generator to apply a signal. As I turned the dial on the external generator at points on the screen the signal would be the amplitude it was suspose to be, move 10mhz and it may be 20 db weaker than it was suspose to be, and at other frequencies it may not show at all. I did some tests and the external generator was putting out.
When I set the 8924c to NO AVG/PK HOLD the signal generator signal would move across the screen like I thought it should. Having it set to AVG value of 1 must have been messing up what the screen shows vers what I thought it should.

Adam,

I have a second 8935 that I had packed away (was awaiting for a unit with the high stab ref), and found the one packed away has the B3.10 firmware. It does go to 1.4 GHZ in Spectrum Analyzer mode, but receive is the standard 400KHz to 1GHz, then 1.7GHz to 2.0GHz.

It Is too bad there is not a source code version of the firmware where it would be possible to alter settings. It would be nice to extend the range for receive, and to maybe reconfigure the CDMA portion to do something different (not sure what though :) ) .

Hi Jerry,

Very good on the unit with the B3.10 firmware. Does it have the high-stab reference board as well?

I have never seen firmware source code for these instruments. It would be great to re-work the CDMA code to provide an I/Q baseband from an analogue input signal.

I did a search on the firmware, but no go. About the only place I can think of which may have it is an HP/Agilent calibration centre. You could try Rick Bowman at Amtronix Instruments.

Adam,

Is yours a E6380A (CDMA) or E6381A (TDMA)

Does the receiver and receiver measurements work from 1400MHZ to 2000MHZ?

Since this is all comes from the same IF, it would seem logical it would allow other measurements then just the Spectrum Analyzer.

Too bad there is not an easy way to hack the firmware as it should be able to go from 1400MHZ to 2200MHZ through the entire receive/analyzer train.

Any ideas how to get the newer firmware to upgrade the older version?

Jerry

Hi Tim,

My 8935 is a late model (S/N prefix GB41) and the firmware version is B.04.00. Its spectrum analyser tunes down t0 1400 MHz.

A non-invasive method for 1.2 GHz operation is an external mixer/LO. One could derive a 200 MHz LO signal by phase-locking a Mini-Circuits VCO to one of the clock outputs from the 8935. A 1.2 GHz bandpass filter at the mixer's RF port would keep down spurious outputs/responses (e.g. the opposite sideband of the mix.)

I'd love this to be possible so I can work on stuff at 1296.

I'll be watching this thread with interest :)

Cheers

Hello Everyone on this forum,

Did my post not generate any interest?

If there really was a way in firmware to extend the receiver to 1.4GHz, who is to say they did not have the capacity to extend the range ( maybe in an uncal mode) to 1GHz? If so, one of these units would cover 400KHz to 2GHz with no interruptions, except to make the jump at 1GHz where the upconverter/downconverter would swap.

Any comments?

On Wed, Oct 30, 2013 at 5:37 PM, <gchafee@...> wrote:

Hi all,

I have been going over a number of bits of older data regarding the HP 8935A's earlier firmware revisions, when I noticed this little item in the A.02.00 firmware:

Agilent 8935 Series E6380A CDMA Base Station Test Set Firmware Enhancements Update

A.02.00 Release Enhancements, February 1999

1.4 GHz Spectrum analyzer frequency extension

Allows you to monitor intermittent/interfering signals at GPS frequencies with the spectrum analyzer. Service providers have found that spectral clearing at GPS frequencies is imperative to CDMA system timing and ultimately network interoperability. Monitoring and spectral clearing at GPS frequencies can help prevent the "island cell effect."

This would appear to indicate the spectrum analyzers ( and therefore the main receivers they are based on ) had extended frequency capabilities beyond the 400KHz to 1GHz and 1.7GHz to 2.0 GHz.

These use the same receivers for the different 8935A and 8286 series, but the 8920's and other related may not have that capability unless they had the downconverter as I would guess this is an extension of the 1.7 to 2.0GHz system.

Does anyone know if the receivers and spectrum analyzers can go down to the 1.4GHz frequency range? I know it would be really nice if the internal converter could make these work from 400KHz to 2GHz with no interruptions ( except probably generate would not work).

Anyone ever see this?

Also anyone ever find if the AF analyzer from a 8920 or 8921 was swapped out for the one in the 8935, if it could then decode radio paging (and the limited trunking decoding from EDACS and other info)? It seems the 8935 is an expanded 8920, but has limited analog decoding.

It would be nice to find a way to turn the quadrature decoding mixers in the CDMA system to use for other non-standard communications protocols. I see the I and Q phase shifted data available on both generate ( transmit) and receive, but probably tinkering with it would end up with a really big brick! It does look like the basics for the first types of SDR radios ( however, this is just to manage signals from the IF).

Jerry

Hi Gerald,

I've finally got around to looking at my firmware rev and its B.04.00
and my SA goes to 1.4Ghz too.

If we could find a way to dump the ROM it might be possible to decompile
the assembler possibly with GDB and get some insight as to what it does.

Or if someone finds a PC card upgrade kit, pull the firmware from that
and take a peek.

regards

Tim

I couldn't find anything on the A9 Power Supply module, but did find this
doc on A's web site that does have schematics for many of the other
assemblies. Makes me wonder of the base power supply was a purchased unit
and they didn't have a schematic for it. The closest it comes is that it
does have the A10 regulator module schematic.

My guess is that RT is a Thermistor; maybe used to shut down if air flow
isn't high enough?

Here is the link to that doc...

Look here for it.  It is about  1.2 GB and will take a while to download.

Slight change of plan. Being as my webhost is not cooperating with the single large file, I removed it. In place, I added another set of smaller pieces to DL. These are from WinRAR, for those familiar with that, and should reassemble using either WinRAR or 7-Zip. Just another option to the original set that Joe created. They can be found here…
http://grovesnet.org/Downloads/

For those interested in getting it in one chunk, Jim has kindly uploaded it to his site here (and it’s working much better than mine did)…

# 1741. 8924C Thermal Printer ESC/POS Support?

Yahoo group: hp8924
Date: 2013-12-18 02:41:12 UTC
From: <zl1cvd@...>
Topic: 1741  Message: 1741

Just tried an Epson TM-88III thermal printer with 8924 & E8285A - prints perfect garbage on both regardless of the type of printer I select. Baud rate, parity, handshaking, etc are all correct. Does anyone know of a serial converter that will take the analyzer output and convert it into the standard ESC/POS command set? I know a PC will do this but am hoping for something a little more compact and perhaps PIC or ATMEL based. Any ideas would be gratefully received. Seasons greetings to all, Chris ZL1CVD.

The POS printers are tailored to just that application. They are also not that cheap. I would have thougt a better choice would be to look for a small or portable printer that emulates one of the printeres supported by the test set. An older photo printer might be a good starting point but check for consumable cost and availablity. Compact laser printers can be picked up for next to nothing. Or look for a ticket printer that is compatible. I have one in the garage that came with ome of my radiation ation detectors. I'll dig it out and see what it is.

I picked up this TM88 for next to nothing. Its much more compact than anything else I have seen. The only consumable is POS thermal paper which is way cheaper than ink/toner + paper. Just a matter of getting it to run. I really don't have the room for those older matrix, laser or inkjet printers...

You can use an HPIB card and software to simulate a printer or external disk drive. This allows you to print and save screens, save settings and load software such as  RF Tools. Free utilities are available, see
http://www.ke5fx.com/gpib/readme.htm
http://www.ke5fx.com/gpib/7470.htm
http://www.hp9845.net/9845/projects/hpdrive/
http://www.hp9845.net/9845/projects/hpdir/
RF tools is in the files section of the group.

You can also remote control the test set from your PC.

Hope this helps,
Robert G8RPI.

Hi Don,

BTS will not run on Windows 7. I have already tried that.

Hi Robert,

The 8935 also allows selection of Epson printers. I shall try it with John’s 7470 Emulator and see whether that works.

Hi,

Don't know about the 8935, but on the 892x you can select diffent printers including epson so that should solve the PCL issue.

Robert G8RPI.

Hello Gerald, Ralph and all,
I already has downloaded the files.
This software is to read the PCMCIA memory card data.
I has installed it but I cant make it work. All the time I try to run it it I get a error message about memory and it try to read a file called test.bin in it instalation folder and it close for it self.
I already has added to command lines to the config file but I still geteing the message.

Any tip?

# 1763. FS: HP 8920B Service Monitor (Spectrum Analyzer+TG+Options)

Yahoo group: hp8924
Date: 2013-12-27 03:53:09 UTC
From: jsternmd@att.net
Topic: 1763  Message: 1763

HP / Agilent 8920B Communications Service Monitor 400 kHz to 1 GHz

Second owner, Unit is like almost new and fully functional. Low hours, bench only, no field use. Case and appearance: excellent++; Operation: works perfectly, passes all internal tests. Screen is clear and bright, no burn in, all controls work smoothly and respond as they should. Small desktop/portable form factor - 7.5"H x 13"W x 19"D at 37 lbs.

$3600 OBO plus shipping.

Standard HP 8920B has a specified frequency range of 30 MHz ☐ 1000MHz with the stock electronic attenuator /input module. This 8920B has the factory installed Mechanical attenuator/Input module specified by HP/Agilent as linear down to 400 kHz providing full continuous range of 400 kHz ☐ 1 GHz. These units also demodulate in real time, with Spectrum Analyzer active, to 1 MHz span, all frequencies.

Options included with this sale are:
☐ High Stability Time Base (001)
☐ Tone/Digital Signaling (004)
☐ Dual-mode Rear Panel Connectors (051)
☐ SPECTRUM ANALYZER WITH TRACKING GENERATOR AND ACP (102)
☐ Factory installed Mechanical Attenuator/Input Module option for 400 kHz- 1GHz range
☐ 60 Watt continuous RF input (100 Watt for 10 sec)
☐ HP-IB, Parallel centronics printer and serial ports
☐ DC Current output rear panel jacks
☐ AC or DC (11 V to 28 V)

I will include Measurement Innovation's RF Tools licensed to this 8920B serial number ☐ current version sells for $290 (Hams) and $950 (non-Hams). (see http://www.measurement.net.au/c/25306/1/rf-tools-software.html ). This is far, far better and easier to use than the Agilent RF Tools Opt 100 iBasic program plus it provides beautiful color, high contrast screen capture).

Features and Details (see http://www.k1jos.com/hp8920b.html )
☐ Boot ROM Version: B.06.01 (last)
☐ More than 20 complete instruments
☐ Accuracy of stand-alone instruments
o Synthesized AM/FM signal generator
o AM/FM modulation analyzer
o Duplex offset generator
o SSB demodulator
o RF power meter
o 60 watts continuous (100 W for 10 seconds per minute)
o RF frequency counter/frequency error meter
o Audio frequency counter
o AF power meter
o AC/DC voltmeter
o SINAD meter
o Distortion meter

o Two variable audio sources
o Digital Oscilloscope (50kHz)
o Weight : 37 lbs, 7.5"H x 13"W x 19"D

The HP Hewlett Packard Agilent 8920B communication test set is a full-function test set based upon the Agilent 8920A design but with increased measurement speed, accuracy, and larger user memory (928 kbytes standard). The 8920B uses PCMCIA memory cards for data storage and radio test programs. The 8920B has the functionality, speed, and accuracy for testing land mobile radios, cellular equipment, and other communications systems while improving throughput and quality in manufacturing.

High resolution pictures: http://www.mv-southerncross.com/ebay/hp8920b/template.htm
The Sale Includes:
☐ HP/Agilent 8920B with front cover and included options noted above
☐ Power Cord
☐ Manuals on CD (Assembly Level Repair, Operations Reference, GPIB Programming, and more!)
☐ Measurement Innovation's RF Tools (licensed to this 8920B serial number)

After sale, I will offer to buyer special pricing for Option 014 6kHz BPF (NIB) and complete CRT replacement Module (NIB)
I don't profit from shipping. I like to "over-pack" with hard-foam protective lining. Only actual costs will be passed to the buyer. I insist that all shipping is fully insured and insurance plus shipping is at the buyer's expense.

Thank you for understanding!
73 Jerry
K1JOS

I was using an old notebook Toshiba running Win XP SP3.
But now it does not run.
After I start the MCE I get the error message about low memory and it close for it self.
I already has tried all tips on the help file without success!

Can You help me please?

# 1765. Possibly damaged my 8924c by using it as a current path to ground

Yahoo group: hp8924
Date: 2013-12-31 14:28:51 UTC
From: <doug@...>
Topic: 1765  Message: 1765

Hello. I have been testing a kenwood hf transceiver with my 8924c. I have discovered that if I disconnect my radio from the tester, then the radio shuts down because it loses its 13.8 vdc rreturn path to my astron power supply. This is all because 1) the astron internally bonds its -13.8 terminal to its chassis, and 2) the power connector on its 13.8 power cable is flakey at the radio end. So all the dc currrent, up to 30A, was passing through the shield of the coax and through the 8924c, to ac ground. whew.
I have repaired and modified the astron and power cables, and ordered new coax patch cables, but my 8924c now has a large error in its rf power meter, especially below 20 meters. Like about 50% low. And I'm not sure if it's related to my power supply fumble. And I don't know where to look in the 8924. Any suggestions? (besides taking a writing class).
thanks
Doug k7kw

Doug,

Have you looked at the manual for the 8920 called the Component Level Information Packet - P/N 08920-90107 (download at http://www.home.agilent.com/upload/cmc_upload/All/8920_Component_Level_Information_Packet.pdf)?
It is a free download from Agilent and has all the schematics for the 8920 which is basically the same unit without some cell site software? Also the Assembly Level Repair guide for the 8924 will give you some high level schematics and module flowcharts. The modules between these two instruments(8920 and 8924) are the same except for a couple of special modules in the 8924 (P/N for this manual is 08924-90061). This can be downloaded from )http://cp.literature.agilent.com/litweb/pdf/08924-90061.pdf ).

I am sure others may have more info about your specific issue, but this is a good start.

Jerry

Thanks Jerry,
This is great advice. I am getting the manuals right now.

Hi Doug,
Don't panic. I don't think you have damaged the 8924C. The power meter is only specified to work down to 30MHz, soI'd expect to see errors at lower frequencies. It's only specified to +/-5% at best. The low frequency roll off is due to the electronic attenuator used in the 8924C. The DC blocking capacitors (and possibly PIN diodes specs) limit the low end.
The DC current will have gone through the shell of the 8924C's input connector straight to the chassis. The only thing you may have damaged is the electrical safety earth in the power cord or the short cable between the mains filter and the chassis. Not a problem if you still have continuity from the power cord to the chassis.

Robert G8RPI.

So my 8924c is labeled that it goes down to 400kHz so I'd expect better accuracy than I'm getting. Maybe something else failed. It's also rated for 100 watts, and I have never seen the high temp warning activate.

Could you clarify whether the high temperature warning is related the RF power input function? It isn't clear whether you are saying that whenever you feed RF power into it it produces the warning or whether you are getting a warning telling you that the whole unit is getting too hot. I would assume that you have tried powering the 8924c down, allowed it to cool completely, and then re-booted it.

OK,
so it says you have the mechanical attenuator option. Did you ever check the LF accuracy before this incident? I still can't see how passing dc current through the screen would cause damage, it's solidly grounded in the unit, at the front panel, attenuator and the A5 input assembly.
If you have not checked the accuracy before it's bossible the the calibration data is wrong or possibly the mechanical attenuator A5 module was swapped for an electronic one.

Attachments: 2 described; binary payloads are missing from this source WARC

I’m not 8924 expert, though I use them, however I would be hard pressed to think that what you described would do anything detrimental to the instrument. That sort of thing happens all the time in labs and service shops. I’ve done it myself many times, and most instruments are very well protected from such things. Unless you drew hundreds of Amps, it really shouldn’t do anything to it, and even then, it would probably just burn up a cable or blow a fuse externally.

So just thinking through your problem:

1. Your HP8924 extends down to 400KHz. I have one that does too, and it reads power fine down to less than 400KHz. So I think yours should too.

2. Yours has given you NO warnings and NO alerts, correct?

3. Does your HP8924 read power correct at other frequencies?

4. What modulation modes and test signals are you testing from the Transmitter?

5. You believe the instrument is reading incorrectly why? Do you have a calibrated wattmeter verify it with?

6. There is a power offset factor which you can program into the 8924. By chance has that been done and forgotten about?

Subject: [hp8924] Possibly damaged my 8924c by using it as a current path to ground

Hello. I have been testing a kenwood hf transceiver with my 8924c. I have discovered that if I disconnect my radio from the tester, then the radio shuts down because it loses its 13.8 vdc rreturn path to my astron power supply. This is all because 1) the astron internally bonds its -13.8 terminal to its chassis, and 2) the power connector on its 13.8 power cable is flakey at the radio end. So all the dc currrent, up to 30A, was passing through the shield of the coax and through the 8924c, to ac ground. whew.

I have repaired and modified the astron and power cables, and ordered new coax patch cables, but my 8924c now has a large error in its rf power meter, especially below 20 meters. Like about 50% low. And I'm not sure if it's related to my power supply fumble. And I don't know where to look in the 8924. Any suggestions? (besides taking a writing class).

thanks

Doug k7kw

Not to sound like I am not following the others train of thought, and looking at your original post, by any chance none of the "patch cables" you used melted and had the center conductor touch the shield did they?

I would suspect you would have a lot bigger issues if that were the case.

Good note.
Everything was running ok when I disconnected one coax cable and watched
the transceiver shut down, so I don't think I had any near-direct shorts.
But that reminds me, that I have left this same configuration powered on
overnight a couple times. I can visualize an ugly series of events.
I just checked my third astron ps and it had dc negative bonded to case
ground too, and I removed that connection. It's worth thinking about.

Which end of the coax did you disconnect with power on? If it was a PL259 at the transceiver end, it's possible that the screen disconnected before the center conductor. If the tranceivers antenna port is DC coupled then you may have passed DC into the attenuator. Note to self: Always switch off before disconnecting.
Does the spectrum analyser give correct levels and are they the same for both the RF IN/OUT and ANT ports on the 8924C? The RF IN/OUT port goes directly to the power attenuator which should be able to handle 13.8V (<4W into 50R) without damage but there may have been transients and the power sensor is fed from a splitter just after the attenuator so may be susceptible, but it all seems to be DC blocked. The high power option has more attenuation so damage still seems unlikely. Sorry to repeat myself, but are you sure it was OK at low frequencies before?

Very bright way to check the effect on receive sensitivity - I will test
that and compare it with the ant port. Also, I am NOT certain that low freq
power readings were correct ever. I've been hacking at this one project for
a long time, bu I have also had the same astron power supply for a long
time and may have busted whatever I busted several months ago.
thanks a lot

Doug,

When you say "everything was running ok", was it reading what you expected then? and now it doesn't? Or are you saying the transceiver no longer works right in some other way?

I can't help but ask why do you think the HP8924c is reading wrong? What is your calibrated reference? How much is the HP reading and how much is your other reference? Is the reference another watt meter? Another analyzer? Are you switching cables or adapters when you connect to your good reference meter?

Maybe I missed it, but I'm not seeing any description of why you think it is not reading correctly. If you just aren't reading what you think you should, with no reference to compare against, then who knows, it could be transceiver? the cable? adapters? the instrument? Maybe you bumped the power setting on the transceiver, or switched modulation modes? If I were a betting man, I'd put money on it being the "device under test", the transceiver, or cables, and not the HP.

The "mistake" you describe should not cause any damage to the instrument. It happens all the time in the real world. Probably every day of the week in every shop in the world that does real radio repair work. DC power supplies in repair shops are often grounded to the system or bench ground.

If it were me, I would focus on positively identifying that the instrument is in fact not reading correctly. After 4 decades of troubleshooting radio equipment, I can say that the most prolific amateur troubleshooter's mistake is not trusting your equipment. HP equipment is amongst the best there is, even when old. The toughness and quality of any instrument that HP ever made is probably magnitudes above the very best that Kenwood ever produced. I'm not saying the HP can't be broken or out of calibration, but the odds are against it. Fixing things that aren't broke is the second most prolific troubleshooter's mistake.

Garret

So all the dc currrent, up to 30A, was passing through the shield of the coax and through the 8924c, to ac ground. whew.

I have repaired and modified the astron and power cables, and ordered new coax patch cables, but my 8924c now has a large error in its rf power meter, especially below 20 meters. Like about 50% low. And I'm not sure if it's related to my power supply fumble. And I don't know where to look in the 8924. Any suggestions? (besides taking a writing class).

thanks

Doug k7kw

Hi Doug,

There is a distinct possibility that your unit does not read correctly below 30Mhz.

I have an 8935, calibrated by Rick from Amtronix, and current cal expires on 8/17/2014

My 8935 doesn't ready correctly below 30 Mhz and is easily 30db down at 400Khz. I asked Rick about this last year and here is his response...

> /On 5/04/2013 1:16 AM, Amtronix Instruments, Inc. wrote: //
> //Dear Tim, //

> by Agilent of this issue several years ago. They figured it wouldn't
> be used below 30 MHz so did not want to spend the time / engineering
> to have the power meter in cal below that freq. Rick /

Even thought your unit is not an 8935, I wouldn't be surprised if it behaved the same.

Mind you the 8935's spectrum analyzer is closer to the correct value.

i.e. At 7Mhz, using the output of my FT817 as a sig source, the 8935's TX power meter in the RF Analyzer section reads 3.25W. The 8935's Spectrum Analyzer reads 36.37 dBm which is ~4.23W, the RF Tools power meter reads 3.27W. The Bird 4410 reads 4.8W

At 1.8Mhz its worse... the 8935's TX power meter in the RF Analyzer section reads 1W, the SA says 35.95dBm aka ~ 3.92W and the 4410 says 4.2W

The lower you go, the worse it gets.

I often compare the 8935 readings against my Bird 4410 with appropriate slugs. If I want to be precise I have an HP8566B SA that I use with calibrated, high power, attenuators to get closer to reality if I suspect things are not right.

You can apply offsets in "Inst Config" for your RF In/Out and save that, with other settings,in the macro keys, so that you can switch bands and have the unit set up correctly for that band rather than having to visit all the menus to apply offsets, center frequencies etc.

When measuring anything, its always handy to have 3 ways to measure what you expect. If those instruments are reasonable then whatever 2 systems measure the same, that is probably close to your value.

regards

Tim

# 1779. Software for HP83236B

Yahoo group: hp8924
Date: 2014-01-04 00:53:28 UTC
From: <donald_s_58103@...>
Topic: 1779  Message: 1779

Hi all,

I have been looking for a PCMCIA card with utility software for the HP83236B PCS interface. The part number is 83236-61002. If any of you have one that you no longer need, I would like to buy it from you. Please note that part number 83236-61001 is the same software, but on an Epson card. This will NOT work with my setup. It HAS to be a PCMCIA card. If the actual card is not available, if someone could upload the card contents to the file section, I could transfer it to a PCMCIA card that I have.

Thanks!

Don

Hi Garret,
First thing to try is removing the pcbs with memory (EPROM) on them, re-seat the chips, plug the boards back in and see what that does. It's generally not nessessary to remove the chips completly, just ease tham up in the socket at each enad and push them back down again. use reasonble anti-static precautions.

# 1784. RE: Non-recoverable firmware error... Help!

Yahoo group: hp8924
Date: 2014-01-15 10:29:05 UTC
From: <zl1cvd@...>
Topic: 1781  Message: 1784

I have seen a few units give this and similar firmware type errors with a failing power supply.

I would not suggest you try reseating any chips at this stage. The firmware that is reporting this error is located in 4x FLASH EEPROMs located on the A16 Host Controller card. They are SMD devices soldered to the board and non removable in any case.

The power on self test has failed whilst trying to initialise the CDMA Call Controller part. 1st I'd be checking that all the red Out Of Lock (OOL) LED's on Sig Gen Synth, Receiver Synth, CDMA Reference & LO/IF. If any remain illuminated when the error message is displayed, there is a very good chance a power supply rail has failed - quite probably the +40V rail. If all OOL LEDs are out, then I'd still be looking to confirm all PSU voltages are correct. If you can get it to boot up properly, go to tests, internal ROM and run MSDIAGS3. The Self-Test option checks all internal voltages. If voltages are OK, look at removing, cleaning and reseating all CDMA related cards as a dirty/dusty unit can pop up with problems like this - especially if its been dry and then operated in a humid environment such as a propane gas heated shack/workshop.

Cheers & regards from New Zealand where No8 fence wire is the fix to most things because HP just aint here!

# 1785. Win64 screen capture for 892x, 8935 & E8285

Topic: 1765  Message: 1787

Hi Garret. Thanks for the help.
1. Your HP8924 extends down to 400KHz. I have one that does too, and it reads power fine down to less than 400KHz. So I think yours should too.
Great - that's what I wan t.
2. Yours has given you NO warnings and NO alerts, correct?
I have seen no warnings or alerts, temperature or otherwise.
3. Does your HP8924 read power correct at other frequencies?
Yes, at 14MHz and above
4. What modulation modes and test signals are you testing from the Transmitter?
Only steady carrier, no modulation tested.
5. You believe the instrument is reading incorrectly why? Do you have a calibrated wattmeter verify it with?
My other wqttmeter isn't calibrated that I know of, bu I have two that seem to be correct in other uses, and both agree that the 8924 is way (like >50%) low.

6. There is a power offset factor which you can program into the 8924. By chance has that been done and forgotten about?
Well, there's something here. I modified this 8925 from the 6W input to 100W input by replacing the load resistor. Right after that, I was satisfied that it was reading correctly on signals whose power I knew. I may have not tried VLF signals, though. Perhaps I merely need to re-calibrate. "Merely" is still daunting to me. Is there simple doc on how to recalibrate? I have some flash cards and a (sort of) standard I can use.

Doug

Hi Doug,
What software are you using to write to the card? Windows (and even DOS) uses formatted disks. The test set uses binary files so you need to use a program such as MCE to write to the disk. see the updated readme file.

HTH,
Robert G8RPI.

Robert;
Could you share some kind of primer on what types of cards work in the test set, including memory limitations. I would also be interested in whether a DOS formatted card with programs will be read by the test set. I have two ways to program. MCE in a laptop with PCMCIA and DOS 5.0 in an HP Palmtop. The latter I think works, though some cards are unidentifiable in either program. Trying to research this is confusing. Some experienced guidance would be helpful.

For example, are any FLASH RAM cards useable for either programming or calibration? What cards other than battery backed ones are useable?

Hi All,

Not wanting to complicate things much more, but I would like to ask if along with what Doug asked, Is there a way to pull cal data ( and other data) back from the test set to the card. For example, if you have a module that you wish to swap and the cal rom is not located on the card? Or pull the firmware information ( in their assembly language of course)?

Thanks,

Jerry

Hello, Al and the group--

If the switches are the same as described here...

http://www.edn.com/electronics-blogs/test-voices/4378128/5060-9436

...They're indeed repairable. I used a stainless-steel feeler gauge
(available as part of a multigauge tool in most automobile-supply
stores) of 0.002-inch thickness to provide replacement springs.
You can use good-quality scissors to cut the material to size.
If you have access to a source of 0.002-inch-thick "shim stock"
that'll work fine.

It's interesting to note that rarely (or if ever) do auction-site
sellers of older HP test equipment mention the condition of the
instruments' front-panel switches...<g>.

Hi,
The buttons on the 892x series are not the type described in the EDN article. They are moulded rubber with conductive pads pressing on a PCB. They are fixable. First thing to try is a gentle clean. Use warm water with mild detergent (dish soap) on the rubber part and mild solvent such as isopropyl alcohol on the PCB. If this does not work you can buy kits to refinish the conductive parts. See
http://uk.farnell.com/circuitworks/cw2605/rubber-keypad-repair-kit/dp/128790 or
http://www.amazon.co.uk/CHEMTRONICS-61923-RUBBER-KEYPAD-REPAIR/dp/6095017688

Hi Richard,
You are probably missing the coaxial cable (BNC to BNC) link from "10 MHz OVEN OUT" to "REF INPUT" on the rear panel. These are the second and third sockets from your left as you look at the rear panel. If this does not fix it check for a 10MHz signal on the oven out connector.
B.T.W posting the same question three times in half an hour will not improve your chances of a response. This is a small group and we are not all monitoring 24 seven. I'm several time zones away so was in bed when you posted.

HTH,
Robert G8RPI.

Sounds like your power supply is defective. Have not looked at the manual but there should be a separate output for the OCXO and that may be missing.
You should have the green LED on the back which is for the separate "standby" supply and I believe you need that before the main supply will come up from the on-off switch so that 15VDC ( IIRC ) output may be low or missing at the output connector to the OCXO.

One thought would be to use an external 10Mhz reference and see if that resolves the issue and than remove the million screws to look at the outputs

replied in the other thread.

AS in the other thread try using an external 10Mhz, verify you have the green LED on the back ( you should if it turns on ) and then look at the manual or the label on the power supply ( old ones had one ) for the 15VDC standby voltage pin and verify you have it.

Other quick thought would be to verify the 10Mhz reference output ..sounds like it may be missing. Remove jumper and use a scope /counter to verify.
Should be a pretty healthy 10Mhz signal....around 1V p-p at least . Check the 8924C service manaul to be sure though.

The green lite is on it starts up and runs but you have had a error. I just started it up and now it is running ok the error is no longer there.
That is a strange one I am going to leave it run all day here and see what happens.
I want to get it fixed so I can fell better when I sell it.

I sold it two weeks ago and the fellow got it and plugged it and said that it don't work it don't start up.
Well the unit was shipped to the East Coast and Fedex stopped running si it sat in the trailer somewhere for 3 days. When he got it he wrote me that just got it 10 min ago and plugged it and did not work but the green lite was on. You need to let some thing that sit to get to room temp.
So he made a claim with Ebay and had to refund his money.
So then I ordered a remanf updated power supply with 2 year warr.
So that is the whole 2 cents.
Well after an hour it is still running just fine.

The 8924C uses a Ovenized reference oscillator. The normal warm up is 15 min. AFTER plugging into the power The OCXO is powered from the 15VDC stnadby supply so it is always on if the unit is plugged in
If the unit was stored in a cold environment would have waited at least an hour before even plugging in to let the components get close to room temperature.
Given the weather we had had recently a 24 hour wait would not be unreasonable.to allow the components to warm up before plugging in and then waiting the 15 min to turn on from the front switch.

The HP test gear is designed to handle a broad temperature range but that's when it was brand new.
Taking the HW from a potentially sub-zero storage to immediate power on would not be recommended given the age of the hardware ...just begging for hardware to break given the thermal stress never mind the self test failing for awhile.

I guest the short version is that I am not sure anything may have been broken ...just not fully warmed up and stabilized enough for the equipment to work fully and pass self test.

Here are a couple observations based my experiences.

I know that this is a pain, given the number of screws involved, but you might want to carefully pull and re-seat the boards if the problem comes back. Generally, the are pretty well held into the unit but removing and re-seating boards can help clean the contacts. There is a warm up time before the reference oscillator stabilizes, but I haven't noticed that impacting the ability to turn on the unit and go through the self test with a good power supply.

Be aware that the start-up problem is usually caused by one or two capacitors in the power supply that seem to eventually fail in most units. There are postings and pictures here on the group about replacing them. It's pretty straight forward. I replaced my power supply and then repaired the original one. Now, I have a spare. Note that one of these capacitors is on a small vertical PC board. I found it easiest to remove the little board, replace the capacitor and reinstall it.

It has been a while, but I seem to recall that with the old supply, the unit sometimes behaved strangely if I didn't leave it plugged in between uses. If I left it connected to AC constantly, it always worked fine. Now, with the new supply (and with the one I repaired) it doesn't have the problem.

Thanks for the great info. Maybe you got the same replacement supply like I got last week.
I would of keep the old supply if I was going to keep the unit but plan to sell it.
The supply has been updated and the failing parts are upgraded.
So I am going to leave it run for today and see if all stays running.
IN a few days I plan on selling it again and hope there will be no issues.
The unit is good shape no real damage the tube has a minor burn in on it but dose not affect the reading of the screen at all.

You might consider including the old supply with your listing, noting that it can be easily rebuilt and kept as a spare. Or you could sell it separately for parts. I would think that there are folks out there who might want to rebuild your supply, keep it as a spare, and then swap it in when their existing supply fails. I was thinking of selling my now rebuilt supply for a cheap price just to get rid of it but I have decided that it's probably worth hanging onto as a spare. It doesn't take up a lot of space.

From: Bill Black
Topic: 1803  Message: 1817

Hi Richard and the group

I get the same Ref unlock message with beeping when my 8924C starts up. Depending on the ambient temperature it can take 5 to 30 seconds to clear the error, while the error is present I can hear frequency instability if a radio is connected.

The power supply is original. It became difficult to start last year especially when the ambient temperature was low (aiming a fan heater at it for half an hour got it going), but eventually would not start at all. The green LED stayed on but may have been dimmer than it should. The capacitor replacement procedure in the files section fixed the problem.

Daunted by all the screws to remove to get inside I've opted to live with the unlock at start up but assume that the oscillator is not getting full time power to the other even though the green LED on the back is lit.

Hope this helps.

Bill

Hi Bill

I ran mine with that errors like 4 hours and the same thing the error.
I turned it off and removed the BNC jumper on the back and looked it and put it back on.
Same thing left it run for a few min. and the error went away.
I ran it all day yesterday about 12 hours and never missed a beat.
Re-started it today same thing works fine.
So I don't no I am waiting for the guy that I purchased this supply from comes back from vacation to see what he has to say about this matter.
So I don't no if the UPDATED PS REMANF has a problem.
I don't like these intermittin problems.

Richard

I recently turned my 8924C on after not using it for a few months, and saw that it had forgotten all the setups I had put into memory. So, I pulled out the A8 Memory board, and, sure enough, the battery was dead. I had replaced the battery a while back, so I wondered what was wrong.

I temporarily installed a two-cell holder with a couple of 2500 mAH NiCd cells to get it going again. Then I set up a test to measure the current out of the battery.

I discovered that the memory keep-alive current is about 0.75 mA (unit powered off), and there is a small "charging" current of about 20 uA with the unit powered on.

Since the Lithium back-up battery is a 1200 mAH unit, at 0.76 mA, it should only last about 65 days with the unit powered off.

Apparently the designers assumed that the unit would be powered on most of the time.

So, I'm thinking of leaving the NiCd cells in place, and modifying the circuit so that there is a reasonable charge current when the unit is powered on. That way, when I turn it on once a month or so, it would re-charge the NiCd keep-alive battery.

I considered trying to tap into the 15 Volt "standby" voltage, but this would probably be much more difficult (why didn't the designers set it up so the "standby" voltage kept the memory alive???)

So - Any thoughts or comments? I would be happy to hear some other ideas before I go charging off into the wilderness.

John K.

Hi John,
750uA is far to much current for the battery backup. I suspect that you have a leaky capacitor, isolation diode or PCB contamination (dust, battery leakage). Less likely but still possible is a faulty SRAM chip. The Litium cell should last years even with the unit off. There should be no "charge" current into the battery so this could indicate a leaky diode.

HTH,
Robert G8RPI.

I have an HP 8924C with the 100W input attenuator.

Recently I noticed a discrepancy between power readings it gave me and a Daiwa cross-needle wattmeter. After more investigation, I realized the HP was no longer showing power above around 13 watts, regardless of input.

Before I ship the thing off to someplace to get fixed, is there anything I can check myself? Does this behaviour perhaps sound like a unit that has "forgotten" that it has the high power attenuator installed?

Thanks

Topic: 1821  Message: 1827

I FIXED IT!

I presumed that the backup circuit was the same as the 8920, so went looking for the related parts on the 8924 memory board.

I removed the associated tantalum caps - no change. So, I decided it was either the pass transistor or the Zener diode.

Amazingly, Mouser has both components in stock, so I ordered ten of each.

They came today, I replaced both the transistor and the diode, and now I have 2.3 uA drain from the backup battery.

Now, it will probably outlast me!

How would rate the Fluke 6071 in comparison to the freq generator in HP service monitors?
Also, how would the service monitor counter compare to an EIP 351C1 counter?
I am primarily concerned below 1 GHz.
I am thinking of getting a HP service monitor and wondering if it a good idea, I am mostly concerned about accuracy. The monitor would save some space on a cart since theoretically I could get rid of the big counter and big freq gen and my big spectrum analyzer.
I would also gain an RF ampmeter.
I understand the scope is only 50K and the audio gen and function gen are quite low in freq also.
Is this a good idea to use something like a hp8924c?
I really have not used a HP service monitor so I am asking for advice.
Any comments would be useful.
I use HP8553B spectrum, 1980B scope, 3456A voltmeter, and have 54200D digital scope
Thanks in advance,
Wally

Hi Wally,
If you are servicing analog VHF/UHF radios you will not regret getting a 8924C.
Firstly accuracy. The 8924C has a high percision ovened oscillator so frequency accuracy will be better than the Fluke, even if the Fluke has the optional ovened oscillator. There is no comparison on the spectrum analyser, The 8924C wins hands down. I assume the 8553B is in a 141T mainframe. The 141T is analogue and drifts a lot (even with phase locking), I've owned and used a few. The 8924C SA is digitally synthesized and does not drift. You have automatic markers with on screen readouts of level and frequency. You also get a tracking generator to adjust filters etc. The frequency counter in the 8924C is as accurate as the EIP but does not have the range, just 1GHz. The 8924C also gives you an RF power meter, Modulation meter, full coverage receiver, full coverage transmitter (yes, there is a mic socket on the front panel, only low power though) CTCSS encode and Decoding and audio signal generator and voltmeter. The onlt downside of the 8924C is the
size and weight, but losing the 141T will compensate for most of that.
The 8924C also has computer connectivity and affordable options include software for return loss and VSWR measurement (with a directional coupler), scannnig receiver etc.
The only thing I'd swap my 8924C for is a 8920B with SA option! Go for it. I've used HP 892x, IFR, Marconi and R&S test sets and the 8924C holds its own.

Robert G8RPI.

The instruments you are compairing it to are somewhat differant so it is hard to compair.

I have a hp 8924C.  Make sure you get the C version.  The frequency is very accurate.  The best I can compair with is to set it for WWV at 20 mhz and it will only show 20 mhz or 19.9 all the way to the last cycle on the display.

I don't recall the lowest it will go, but it is lower than 500 khz.  The 8924 is not calibrated for power either in or out below 30 mhz,but it is about 3 db off at 10 mhz and more as you go lower.  For anything between 30 mhz and 1 ghz it will do almost anything you can think of for testing receivers and transmitters.  Add a return loss bridge and it will tune duplexers very well.

The manual for it is almost useless unless you are servicing the old analog phone systems..  Get the one for the 8920 as it is very similar to the 8924.

The 8924 usually has only a 3 watt input but there are some that have a 60 and 100 watt input rating.  The 60 watt unit will take slightly over 100 watts for about 10 seconds with a rest periond of several minuits.

If you have not seen it, you may want to check it out here.
http://www.amtronix.com/hp8924c60.htm

As it does so much , plan on spending a lot of time learning how to use it.
Then it is simple to setup.  I put mine on a roll around tool box from Sears as they do weigh about 65 pounds.

Thanks for the reply, Yea I read about the "C" model and I think you are right in recommending it.
It would be nice to also have the higher watt version, but I mostly need the low or milliwatt capacity.
I was also wondering about the coupler and the software (card)
Does it work kinda like a time domain reflectometer for analyzing feed lines and connectors and antenna stuff?
Also the oscilloscope function seems pretty wimpy, really only an AF scope.
That does not bother me since I use a HP1989B scope (which also weighs about 60-80#)
I really like my scope.

Robert: Sorry I did not see your nice response before I wrote my previous response.
Thank you for your informed response. No too many people are familiar with this barnyard of equipment that I collected (and repaired).
Sounds like the right thing to buy, I do work on some VHF stuff but mostly on RF Ham stuff.
I really am getting too much weight on my test equip cart and think this will be the way to go.
If I can get rid of the spectrum analyzer and the fluke freq generator and put the EIP freq meter away for now,
It should keep me from going right through the floor!
If you have the time please comment further on using the 8924 for time delay reflectometry ( feedline and connector analysis) and comment on the scope function.
I also think I need a good frequency reference, I wonder what you think about GPS disciplined frequency standards vs Rubidium without GPS. I have read some of the comments on "Time Nuts" and would like to hear your comments.Maybe I really do not need anything special.

The software card is not too much use to many.  If you are doing alot of testing on the same kind of radio, it may be useful for running automatic tests.

The retrun loss bridge is sort of like the TDR, but also much differant.  It is really a SWR bridge so to speak.  You hook it up and use the spectrum analizer and tracking generator. You then set a sweep over the frequencies you set up for that will give the return loss.  The SWR and RL is actually the same thing when talking about antennas.  One is just stated in DB and the other as a ratio.  For simple purpoes think of it as a graph showing the swr over the range of frequencies you set it for.

Yes, the scope is not much out of the audio range.

There is an application manual for the 8920 that explains how to set it up and many of the things you can use it for.  The 8920 is about the same as th 8924 without the cell phone stuff.  The manuals are free to download from the files section here or the Agliant website.

YOu can also set the 8924 to come on the way you want it to if you run one test much more than others.  There are also some memories so if you have tests you want to run, you just save the setup to memory and you can get to them by pressing a button or two.

How accurate do you need to be on the frequency ?  I am thinking the 8924 is good to about 100 hz near 1 ghz and less as the frequency goes down.

If you are mainly going to work on HF stuff, you really want the 8920 with the options.  It will cost about 3 to 5 times as much as the 8924c.  The 8924 will work below 30 mhz but  as I mentioned the power calibrations are off some to about 10 mhz and really off below that. The 8924 works very well to atleast 1 mhz if you don't care about the exect db being correct.
Above 30 mhz it is right on.

If you work with low power the 3 watt limitation will not be much of a problem.  Some work around that by hooking up an external 20 db pad to it.  Then you can set the 8924 software to compensate for that.

Thanks again Ralph, I have seen the graph of the return loss and It did occur to me that the return loss was really just and SWR reading, made more useful by seeing the return loss over a frequency range.
Perhaps I will acquire a TDR just for the feedline stuff. I can get one for a very attractive price.
I am sold on the usefulness of the 8924. I realize that the dbm accuracy will not be good below 10MHz, but most radio tuning requires looking for a max or min. Freq readings are more critical, in my opinion.
I think I am going to look at one tomorrow.
Thanks again

I don't think you will go wrong for the price of most of the 8924C.  They are usually around $ 1000.  A lot of equipment for the money.  Just be prepared to spend a lot of time with it and you may want to go to the Yahoo 8924 group and look around.  Lots of good info there.

For adjusting for a max or minimum theh 8924c works fine.  The frequency will be  as good or beter than most anything out that is not locked to the GPS system or some other standard external to the device.

A TDR just sends a pulse down the line (so to speak) and any change in impedance is shown up on the trace. The RL usually just shows up as the impedance at the connector of the RLB.

A good TDR can be adjusted to show up impedance bumps in the line and where they are at. Such as I had a feedline that was about 100 feet long and was made up of 2 pieces of hardline with a connector in the middle.  You could just see the connector showing up on the screen. The RLB will not do that.

Hi Wally,
You don't rally need a GPSDO for routine running of an 8924C, it has a good quality ovened oscillator. This was required for the cellular radios. I have a couple of GPSDOs (Thunderbolt, Odetics) and RBs but don't normally connect them to the 8924C. The basic unit will work as a scalar analyser (SA and tracking generator) and plot approximate VSWR (with a coupler or return loss bridge) without additional software. The software card (Declaration of interest, I sell them on ebay item 261407685501 I accept offers of £30 fro list members) Allows you to "normalise" the coupler or bridge, i.e. compensate for losses and frequency response. This gives accurate readings but is slower. If tuning filters it's best to adjust on the basic display and then check with the software. The software also has a TDR like cable fault function but I've not used it.
On power, I prefer an external attenuator as this keeps heat out of the unit and does not reduce the low level sensitivity. Just don't forget to fit it. You enter an offset to compensate for the attenuator so the displayed readings are correct. This means that you can use a odd value of attenuation if you have one.
HTH,
Robert

Many thanks to Ralph and Robert Thanks for the tip on the card that normalizes 8924C power at low freq. Using software to obtain a TDR reading would also be nice.
I put off my visit to the owner of the test equipment to next week, in order to familiarize myself with the service monitor. Apparently a relatively large RF company is letting some old equipment go.
I am still not sure what is available, but there is a lot.Including some very high power RF tubes that I have no use for.(20K watts? or more). All sorts of scopes, don't think I need any more(maybe I'll find a GHz scope though).
Any recommendations on freq standard in case I find one for not too much money?
Any other goodies I should look for? They do have some TDRs and the price is so good I may buy one so I don't have to move the service monitor I will hopefully buy.
It would be a nice thing to take to antenna installations, and would be something I could lend to other Hams with little instruction.

Being that is a 50 ohm input, you would likely load down the circuit you are trying to measure. Perhaps building up a hi-z pad may work.

You can use a scope probe to trace RF through circuits, but, as another poster mentioned, the 50 Ohm input of the 8924 will result in a great deal of attenuation of the signal presented at the end of the probe, so the level readings on the 8924 will be way off.

And, for tuned circuits, the capacitance of the probe will cause a de-tuning of the circuit, possibly to the point of not working, depending on the frequency (higher frequency circuits will be more affected than lower frequency ones).

But, if you probe low-impedance points, the effect of the probe on the circuit will be fairly low.

I often use a scope probe on my 8924, with the probe nearby an active oscillator circuit, (not connected - just near) just to see if the circuit is working, and what frequency it is on.

Use the probe in x1 attenuation. or you should really use a high impedance amplifed probe which has a low impedance output and a high impedance input usually several hundred K by the time you take into account the capacitance. You may remember the old cathode follower probes or emitter follow probes . I picked up several HP probes off BEAY a few years ago for use with a spec an.

From: Ralph Mowery
Topic: 1851  Message: 1852

Here is what I read a while back.

Using the 8924 with a Mini-Circuits ZFDC-20-5 to measure return loss.

The first thing to do is to configure the 8924 for "duplex out" and "antenna in"and set up the tracking generator for no offset. To measure return loss hook the "duplex out" on the generator to the "out" connection of the directional coupler. Then hook the "antenna in" port to "couple" of the directional coupler. You can now establish the base line on the spectrum analyzer as this will show infinite SWR or minimum return loss. It should read about 20 db less than what you are generating. Once you've done this connect the load or device under test to the "in" port of the coupler. The space under the base line on the spectrum analyzer is the return loss in negative db. (Note: this may be counter intuitive to some but we're using the directional coupler to measure what's coming back as apposed to what's going out which is what the labels on it are for.)

@@@@@@@@@@@@@@@@@@

Not sure if that is what you need.  I have one and I connect the Minicircuits OUT to the 8924 Duplex Output.  The  MC CPL goes to the 8924 Ant IN.  The MC  IN goes to the duplexer or any other thing you want to see the RL from.

I am not sure about that particular duplexer, but mainly you put a dummy load on the Duplexer antenna and the side that you are not adjusting.  Then you adjust the pass cavities on the side the 8924 is connected to for maximum RL.  Then move the dummy load and the RL to the other side of the duplexer  and adjust it.

To normalize the RL bridge, hook it up as above.  If you set the levels of the 8924 to 0 db then you will see a line about 20 db from the top.  Go to the Aux screen and toward the right you will see something like A,Save B B-A (could be A-B as I am not at my 8924) .  Do not connect anything to the IN port of the MC RLB.  Then scroll to the part mentioned.  Push the know to save B, then push it again to the B-A is highlighted and the trace should be at the top of the screen.  When you connect something to the IN of the MC RLB part of the trace will go toward the bottom of the screen.  The lower the trace goes , the beter the  RL will be.  YOu do not have to normilize the 8924, but it makes it easy to tell how many db down the trace is.

There are some you tube vidios on how to do this,  They are for the E8258 or something like that.  That instrument is slightly diffrant, but the screens are very close.  Also look for info on the 8920 test sets.  The screens are also very close to the 8924.

After that you can remove the RL bridge and set the 8924 up for the notches.  You adjust the notches last.

Thre are probably some files in the group files section that tell how to adjust the duplexers.

If your duplexer is notch only, then you do not use the RL bridge.

# 1853. Timebase issue

Yahoo group: hp8924
Date: 2014-04-09 16:34:48 UTC
From: <audiomenani@...>
Topic: 1853  Message: 1853

Hello, first i have to apologize for my poor english. This is my fist time here.
I´m having a issue with timebase source selector.
Even with the link between oven output and the REF in being connected, the unit (HP8924C) insists to make analog measures souced from internal time base (TCXO).
So in my case, there is an offset, TCXO is out about 144Hz.Then when working at 900MHz, it goes off about 11KHz.
Ok, in service menu has a latch "refs_tbase_select" and the default value is "1".When i change this value to 0 or 2, it select reference source to the REF IN port. and everything becomes ok. (at least, the frequency on the REF OUT port act as if it were).
So when cycle power, by the way, it returns that latch value to the default "1". and i have to run all that menu to reselect the proper value.
FW version of this unit is A.08.02
The question is, someone knows how to change this latch default value? Owners could share this knowledge?
Save preset don´t work for this. I've tried.
.
Thanks in advance.

From: Ralph Mowery
Topic: 1860  Message: 1862

I am not sure if it is in the manual or not.  There are several manuals for the 8920b.

Instead of the expensive RLB mentiioned, MiniCircuits makes one that works very well and is less than $ 100.

Using the 8924 with a Mini-Circuits ZFDC-20-5 to measure return loss.

The first thing to do is to configure the 8924 for "duplex out" and "antenna in"and set up the tracking generator for no offset. To measure return loss hook the "duplex out" on the generator to the "out" connection of the directional coupler. Then hook the "antenna in" port to "couple" of the directional coupler. You can now establish the base line on the spectrum analyzer as this will show infinite SWR or minimum return loss. It should read about 20 db less than what you are generating. Once you've done this connect the load or device under test to the "in" port of the coupler. The space under the base line on the spectrum analyzer is the return loss in negative db. (Note: this may be counter intuitive to some but we're using the directional coupler to measure what's coming back as apposed to what's going out which is what the labels on it are for.)

Look at You tube for some duplexer tuning.  There is a good one for the e8285 which the screen display is very similar to the 8920/8924 series.

# 1865. Re: [hp8924] Where is duplexer tuning in the 8920B Manual?

Yahoo group: hp8924
Date: 2014-05-03 19:15:02 UTC
From: <farson@...>
Topic: 1860  Message: 1865

I have just posted two return loss charts taken on my HP 8935, with an MCL ZFDC-20-5 and an Amtronix SW2012N RLB. The Amtronix bridge is very flat to 1 GHz, but the MCL coupler is pretty decent by comparison. The charts are in the "VA7OJ RLB data" folder in the Files section.

Last year, the RF/microwave parts vendor with the long tent behind the Mendelsons' tent in the Dayton flrea-market had NOS ZFDC-20-5's with N fittings at $35 each.

Hi,
it is also worth noting that if you use the HP RF Tools utility software (11807 Option 100) the normalization process compensates for any variation in the frequency response and flatness of the coupler. While RF Tools "single sweep" is not useful for actually adjustments, it's great for actual measurements. You adjust for best performance in the normal tracking generator / spectrum analyser mode, then take measurements of the actual performance with RF Tools. This allows you to take accurate measurements with general pourpose couplers and bridges. A 3dB hybrid splitter/combiner can also be used as a RLB. A 6dB hybrid splitter combiner (actually 3 3dB ones in one box) with teminators on the middle two ports gives even better isolation. The terminators in the middle don't even have to be high performance.

Robert G8RPI.

Thanks for posting the results of the two RLB. I know the Minicircuits is not as good as the others, but unless you want lab results the one I have seems fine for most testing and tuning. I did compair the results to one that is similar to the 2012. Not sure if it was an IFR or not. If they make one, it was. A 6 cavity 2 meter duplexer could not be improved on with the higher dollar RLB. I would say anything past 25 db in the field is mostly guess work anyway as most dummy loads will have less than that, especially if you throw in some jumpers and adapters. The fact that it is about $ 40 to $ 70 instead of 5 to 10 times the price makes it desiriable for ham use.

I am not understanding  the question.

If you are talking about setting the RF to  milivlots  then you highlight the rf output where you are seeing dbm and on the keypad go to the far right and look for a button with khz and mV on it.  Press it to get to mV.  That would be the darker color key to the far right about 2 rows up from the bottom.  To go to any other measurment such as uV or dbM  highlight the function by pressing the round knob when the curser is over it and then press the dark color button with the desired type of output.

I sold my HP 8920B and have some spare things that would be good for the 8924C as well. If interested, Please contact me direct by email

New CRT Module (Omnivision for HP/Agilent) - LP0619EVC. Amtronix sells these for $500 - This is a complete drop in replacement with all boards, etc. NIB for $250 plus shipping

MVC-007 Videoconverter - like new for attaching external VGA monitor to HP8924C/8902A/B. $125 plus shipping.

New 8920A/B rubber inlay keypad buttons (bought direct from Agilent) - $65 (don't think this matches the 8924C)

thanks

Topic: 1876  Message: 1876

Hi, I am new to this forum and have a question about calibrating the spectrum analyzer on my 8920A it is the opt. 104 version, it show 2 dB less than the actual power level, I have run all internal tests without any errors, any idea on how to calibrate this ?

I also would like to upgrade the 60W input attenuator to the 100W model, I see that people has done this with success on the 8924 model, is this also possible on the 8920 model and if yes how do I upgrade the software and calibrate the unit for this?

Michael, OZ2ELA

Hi Mike,

I joined this group specifically because I found your post about the diags failure... these probably look familiar to you:

RF Input Signal

| Vertical Sensitivity | Lower (Vdc) | Upper (Vdc) | Actual (Vdc) |
|---|---|---|---|
| 10 dB/div (absolute) | 1.608 | 2.176 | 1.590** |
| 10 db/div (relative) | .640 | .960 | .715 |
| 2 dB/div | .480 | 1.120 | .368** |
| 1 dB/div | .320 | 1.280 | .109** |

Down Converters (With Spectrum Analyzer)

| Description | Lower (Vdc) | Upper (Vdc) | Actual (Vdc) |
|---|---|---|---|
| 100 Mhz, 614.3 Mhz IF | -4.500 | 4.500 | -10.294** |
| 500 Mhz, 114.3 Mhz IF | -4.500 | 4.500 | -10.048** |
| 900 Mhz, 114.3 Mhz IF | -4.500 | 4.500 | -5.817** |

Ultimately, I can't find a post on how you solved the problem. Can you share what the solution was?

Thanks a bunch,

Michel

You may want to check the specs on the 8920A and that may actually be in the range but on the edgeof the limist.

I would like to be able to adjust this as well to tweak those units up since the 8920 and 8924's appear to drift low over time.

It would be a matter of going into service mode and adjusting the values.

The question is the procedure and which values to adjust.

The attenuator procedure would be the same as the 8924 but the issue is you need the older Epson style SRAM cards to do this the factory way and a PC with an EPSON memory card slot.

Other way is to go into service mode and adjust the values for the attenuator directly. Believe there are some posts on doing this since the initial cal data supplied on the board may be off slightly.

# 1882. FS: HP 8935 Carry Case

Yahoo group: hp8924
Date: 2014-06-29 17:56:08 UTC
From: Frederick Bray
Topic: 1882  Message: 1882

Good Morning,

I happen to have a spare yellow nylon carrying case for the HP 8935 that is surplus to my needs. The case is used and in generally good condition except for 2 or 3 holes in the mesh that covers the ventilation openings on the left side of the 8935. These don't affect the utility of the case and the mesh could probably be repaired or replaced. The case has some padding to protect the unit and is designed so that the service monitor can be used without removing it from the case. If you want a general idea what these cases look like, you can see the recent eBay item # 321399576749. (I have no connection with that listing but it does have pictures of the case.)

I am asking $30 for the case, including ground shipping. Please contact me off-line.

Topic: 1882  Message: 1883

I should have added that I will consider offers.

The $30 asking price is to ensure that shipping is covered. It takes up a bit of space in a box because it has a couple of hard inserts in the pockets. Thus, one can't just roll it up and stick it in a smaller box. I haven't got a shipping quote yet. I am not looking to make a profit on it, just to find it a better home for it than the trash bin.

Thanks.

KE6CD

Hi Don,

You have to make the following connections and configuration (as depicted in the manual)

1. From Agilent 8924 DUPLEX OUT To Agilent 83236 FROM DUPLEX OUT
2. From Agilent 8924 ANT IN To Agilent 83236 TO ANT IN
3. From Agilent 8924 SERIAL PORT To Agilent 83236 SERIAL PORT
4. From Agilent 8924 10 MHz REF OUTPUT To Agilent 83236 REF IN
5. From Agilent 8924 POWER DET To Agilent 83236 DET OUT
6. Set the GPIB Address Selector of the rear panel of the PCS Interface as follows.
GPIB/Ser switch: Ser
GPIB address: Any
7. Set up the Test Set:
a. Turn on the Test Set.
b. Press and release the SHIFT key then the TESTS key to access the CONFIGURE screen.
c. Position the cursor in the “PCS Intrfc Control” field, and press the knob to select “On.”
d Turn the Test Set’s power off and then back on.
8. Perform the RF Generator Level Calibration:
a. Press and release the SHIFT key then the TESTS key to access the CONFIGURE screen.
b. Position the cursor in the “RF Gen Level” field, and press the knob to start the calibration.

# 1889. GBS8200/HD9800 "No Signal"

Yahoo group: hp8924
Date: 2014-07-17 17:28:14 UTC
From: rbarrioss@...
Topic: 1889  Message: 1889

Hi all,

I've finally found some time to put together the LM1881 sync separator just to find I am unable to make the GBS8200 (marked as HD9800) work. I followed the great information found around here and this is what I can see:

* Using only pin1 of LM1881 to Sync on P3 (EGA input)

* The sync pulses are almost 5Vpp, 59.1uS high and 4.9us low (15.6kHz)

* Video signal is only around 1Vpp, connected to G input on P3

* Selecting "RGBS" input and using the lower button for the "AUTO" setting. The LED on the PCB flashes a few times and then "No Signal" on the monitor

I am tired and mad right now, don't know what else to check or try.

Your hints or ideas are wellcome.

Thank you,
Roberto EB4EQA

# 1890. Possibly dumb question re: IBASIC commands for the HP-8920 and HP-8922

Subject: [hp8924] GBS8200/HD9800 "No Signal"

Hi all,

I've finally found some time to put together the LM1881 sync separator just to find I am unable to make the GBS8200 (marked as HD9800) work. I followed the great information found around here and this is what I can see:

* Using only pin1 of LM1881 to Sync on P3 (EGA input)

* The sync pulses are almost 5Vpp, 59.1uS high and 4.9us low (15.6kHz)

* Video signal is only around 1Vpp, connected to G input on P3

* Selecting "RGBS" input and using the lower button for the "AUTO" setting. The LED on the PCB flashes a few times and then "No Signal" on the monitor

I am tired and mad right now, don't know what else to check or try.

Your hints or ideas are wellcome.

Thank you,

Roberto EB4EQA

# 1892. Re: [hp8924] Possibly dumb question re: IBASIC commands for the HP-8920 and HP-8922

Yahoo group: hp8924

From: Robert Atkinson
Topic: 1890  Message: 1892

Hi Brad,
The IBasic controller is the same for both instruments so the 8920 manual will have some relevance to the 8922. The 8922M  User guide has programming information see www.home.agilent.com/upload/cmc_upload/All/08922_90211.pdf

HTH,
Robert G8RPI.

Subject: [hp8924] Possibly dumb question re: IBASIC commands for the HP-8920 and HP-8922

Hello--

Pardon me for asking what's likely a dumb question, but I can't
figure out whether a programmer's manual for IBASIC written for
the HP-8920 would be relevant for the HP-8922. My hunch is that
most common commands would be the same, but beyond that
I have no idea what specialized commands would differ.

Thanks, and 73--

Brad AA1IP

Hi Ralph,

True, even the datasheet says that (I'm embarrased). No doubt this LM1881 is somehow misbehaving. The sync output voltage follows VCC, up to 12V...

The converter is not dead (yet), it works find with a VGA source. I will order another (few) LM1881 and try again...

Thank you, it looks so simple now that you said what it was...

Don't feel bad. I worked in TV broadcasting for 35 years (retired 10) and I had to think about your problem. I don't have the 8200/9800. I was able to use a multi sync monitor. I then gave both to my son in Montana.
Good luck
Ralph

# 1895. HP 8934 Modules Available

Yahoo group: hp8924
Date: 2014-07-26 14:14:19 UTC
From: Frederick Bray
Topic: 1895  Message: 1895

Sometime ago, I upgraded my HP8934 by replacing the standard reference module with a high stability module and the receiver with the narrower version. They could be used as working spares or for experimentation.

Since I am doing some cleaning out, I will happily part with the old modules for $10 each or $15 for both, plus shipping. They both should fit into a medium Priority Mail box.

I will take PayPal.

Please contact me off-line if interested.

# 1897. Question regarding power detector accuracy on HP8935

Yahoo group: hp8924
Date: 2014-08-02 23:16:58 UTC
From: george@...
Topic: 1897  Message: 1897

I have an 8935 that I bought two weeks after a calibration. Never pumped a HF radio into it, always VHF/UHF but last night I put a HF rig into it and was about to start troubleshooting the output filter because this 100watt radio showed 18 watts into the 8935 on the 3.8 mhz range. This should have been a 100 watt carrier. For some reason (it was there) I put it on my IFR. It read 100 watts. So did the comparison on several of the hf ham bands. At 7 mhz it was 100 watts on the IFR, 30 watts on the HP8935, at 10 mhz it was about right, but then from there up to 30 mhz the HP 8935 read higher than the IFR. By a boatload. IFR 100watts at 28 mhz, HP 8935 read 271 watts, and gave a high level alarm.

Put it thru the built in RF module diagnostics, etc. Other than showing slightly out of tolerance at 1.7 and 1.8 ghz (under 1%)

So the question is: since these were really intended for land mobile and cellular service is the accuracy in the HF range that I noticed normal?

Thanks

From: Glenn Little
Topic: 1897  Message: 1898

Where did you get a radio that transmitted that low in frequency?
A lot of the cellular system service monitors roll off below 10MHz.
With you trying to measure power at 30 mhz, this
is wayyy below what would be the expected calibration lower limit.
I am surprised that it read anything in the sub
audio range as indicated by mhz.

The 8922 will measure some what correctly down to
10 MHz, then it falls off very rapidly.

# 1900. Re: [hp8924] Question regarding power detector accuracy on HP8935

Yahoo group: hp8924
Date: 2014-08-03 07:16:00 UTC
From: Robert Atkinson
Topic: 1897  Message: 1900

Hi George,
The 8935 and most 8924's use a PIN diode switched input attenuator, rather than the relays used on (most) 8920s. Pins have the advantage of not wearing out, but are a compromise for frequency range. PIN diodes need a DC bias viltage to switch them and therfore blocking capacitors to keep the DC in the correct places while letting the RF through. The small value of the capacitors used limits the low frequency accuracy of the 8924/35. The diodes themselves also have limitations. As these sets were intended mainly for VHF/UHF work, often high volume automated testing, this was considered acceptable and is in th specification. The CW power sensor path is particuarly poor in low frequency response. Using larger value capacitors will affect the high frequency accuracy due to increased inductance.
To avoid this, rather than a 100W modification, I use an external analogue wattmeter (Racal 9103) with a 20dB sample output for HF work with the 8924. You can eneter the external attenuation value into the test set so the sig gen etc readings are correct.

HTH,
Robert G8RPI

Thanks, Robert. That confirms what I suspected. I had never tried to make any serious measurements on anything under 144 mhz since I had it. On a UHF portable it agreed with the IFR and BIRD. Haven't tried high band yet, I'll presume it is ok.

The radio was a departure from my usual Micom mania, this was a Transworld/Datron TW-100.

I would run through the extended RF Tests, Audio Tests and Misc Tests.

Some of the tests require an external loopback cable.

These will isolate the issue and usually identify a defective card ( though sometimes they are not correct )

Tests are built into the firmware and are accessed from the TEST button/screen and selecting the ROM as the source and then browsing down on the bottom left corner to select the test.

AMTRONIX website should have a better description on the process.

# 1907. Using the 8935 to test cross-band repeater mode in dual-band amateur FM transceivers

Yahoo group: hp8924
Date: 2014-08-09 23:43:27 UTC
From: farson@...
Topic: 1907  Message: 1907

I have just complketed a test suite on the new Icom ID-5100. To test cross-band repeater operation, I set up the MAIN and SUB bands on 2m and 70cm FM respectively. LOW power output (5W) was selected to avoid overheating. Next, I activated the Repeater mode on the ID-5100 via menu.

I configured the 8935 with RF GENERATOR on 2m, output via RF OUT, FM with 3 kHz deviation and SINAD scale. RF ANALYZER was set up on 70cm, with input via RF IN and SINAD scale.

The ID-9100 antenna socket was connected to RF IN/OUT on the 8935. I increased the RF Generator output sufficiently to key the radio, adjusted the RF input level for > 12 dB SINAD on 70cn and read off transmitter power output and deviation (from which I calculated the deviation ratio, 3 /deviation displayed on RF Analyzer).

The ease with which these HP test sets can be configured for duplex with separate or combined RF input and output greatly facilitates repeater testing,

Sorry I have not been very clear. This is what I know. The firmware in the 8920/8921, 8924, 8935 & E8285A analyzers use pSOS a RTOS for the 6800 by Software Components Group. All analyzers share similar user interface and features +/- features required for specific hardware. All models support HP's iBasic. Most of the internal calibration and test routines are iBasic programs. If you edit the firmware upgrade images in the 8924 yahoo group, you can see these basic programs.
HP released an add-on suite of iBasic applications called RF Tools for 8920 & 8921 - tools that were already included in the firmware of the 8935. With a few changes, the programs also run on the 8924 & E8285A. They were shipped in a DOS formatted PCMCIA Memory Card.
The 8924 has a memory card 08920-60194 (similar to 08920-60297) which holds RTC, RAM, EPROM, PCMCIA. There are 8 sockets for option ROM being I believe AM27C040-120JC 512Kx8-bit PLCC. Basically I want to put RF Tools into EEPROMS on the memory card but have no idea how to go about it. I can read/write PCMCIA data and have an EEPROM programmer. Any ideas for the next step? I am electrically & RF competent but hate bit banging and have trouble understanding uPs, addressing, etc.

I have a very nice 8924C, recent (but expired) calibration but everything works as it should and frequency within a couple cycles of my Z-3801 GPSDO. Assume all other parameters are also still within spec. being its HP.
Display is excellent, no burns and good brightness (goes higher than needed), but brightness pot. has never been changed (hasn't needed it so far).
This unit has the factory 100 watt continuous load, good off-air receiver sensitivity, very clean and all original feet in pretty good condition. Unit was last calibrated by Amtronix 11/2010, has sticker and that certificate along with the full printout that he sends with the calibration.
Right now I'm looking for best reasonable offer but, if interested, call me and we can arrive at a mutually agreeable price. Also, if any addl. information is wanted, feel free to call or email Would MUCH prefer local pickup if possible but still have the box with foam-in-place packaging though its had three trips on it (original purchase and to/from Amtronix). Email is wb6dgn_tom <at> a t t <dot> net (don't forget to take spaces out of a t t). Email for phone number in Norton, Ohio. Thanks for looking.

I have a late model Agilent 8920A along with an Agilent 82357B USB/GPIB interface. Computer is IBM Thinkpad laptop running XP. Connection between the the 8920 and computer using Agilent software with this setup is great. I purchased a PCMCIA card so I could run RF tools and learned the hard way that the 8920A does not have a PCMCIA slot. I then joined this group and downloaded from the files section the RF Tools software. I have read through all the posts in this group and see many ambiguous threads about using the HP Drive software to upload RF Tools. But I am getting old, don't know a lot about computer programming (at any level) and am not able to figure out how to do it. Could someone who understands how to do this and who has actually done it send me the specific steps (a prescription) in programming both the computer and the 8920A. Thanks - any help will be greatly appreciated.

Topic: 1916  Message: 1918

Hi,
I can't send specific steps as I don't have the same hardware as you (no 8920A), but "programming" should not be rquired. If you install HPdrive 3.01 it should emulate a standard drive. The only possible issue is support for your USB GPIB I/F. Type hpdrive <imagefile> ( <imagefile> is the name of file you want to access) and then follow the 8920A instructions for using an external disk drive. Make sure you back-up any RF-tools files incase something goes wrong. Once the file is loaded on the 8920A you can disconnect the PC if you want to go portable. If you want to access multiple files you can follow the HPdrive instructions to set up as a hard disk drive, I suggest a 9133B or 9134B. see progamming guide http://www.keysight.com/main/redirector.jspx?action=ref&cname=EDITORIAL&ckey=1000001086%3Aepsg%3Aman&lc=eng&cc=US&nfr=-536900808.536880153.00 chapter 6 on how to use an external drive. Oh and use the RFTools files modified for the 8920x

HTH,
Robert G8RPI

Subject: [hp8924] Programming Agilent 8920A with RF

I have a late model Agilent 8920A along with an Agilent 82357B USB/GPIB interface. Computer is IBM Thinkpad laptop running XP. Connection between the the 8920 and computer using Agilent software with this setup is great. I purchased a PCMCIA card so I could run RF tools and learned the hard way that the 8920A does not have a PCMCIA slot. I then joined this group and downloaded from the files section the RF Tools software. I have read through all the posts in this group and see many ambiguous threads about using the HP Drive software to upload RF Tools. But I am getting old, don't know a lot about computer programming (at any level) and am not able to figure out how to do it. Could someone who understands how to do this and who has actually done it send me the specific steps (a prescription) in programming both the computer and the 8920A. Thanks - any help will be greatly appreciated.

# 1919. Reference Levels

Yahoo group: hp8924
Date: 2014-09-28 03:19:25 UTC
From: tomasguerro@...
Topic: 1919  Message: 1919

I am still trying to learn the 8924C and making progress. At question today is the ref. lvl at the bottom of a spec analyzer screen as well as the signal level below the frequency at the top-right of the spec analyzer screen.

The reference level goes +/- 50dB. But what does it do? I generally try tuning a repeater using 0dB but I see more grunge as I bring it up to -50dB as if amplified. What is it doing?

Lastly, what does the signal strength mean? It appears coordinated with the ref. level.

Thank you in advance.

I think the scope screen has 8 devisions. That is good for 80 db. When the refference is at 0 db that is the top of the screen. As you go down from there each devision is 10 db. That means the bottom of the screen starts off at 80 db below a 1 milliiwatt signal. That is not very sensitive. when you crank in a referance of -50 db that makes the screen start at -80 + another -50 or -130 dbm. That is really below the basic sensitivity of the spectrum analizer receiver. Don't recall, but think the best the receiver will do is about -110 dbm. That is why the 'grass' will come up a devision or two on the screen.

What you are seeing with 0 db as the referance level is only -80 dbm. Not much thermal noise there. Think of it as a receiver with a large atteunator of about 40 db at the antenna connection. You will not hear very much. As you lower the value of the atteunator you will start to heat the thermal noise. This is why you start to see more grunge.

Put a short antenna on it if you are close to one of the Weather stations near 160 MHz. Set the refferance to -50 db and look at the signal, then as you go to -40, -30,-20 and such you will see the signal get shorter on the screen. If you set the bandwidth small enough you will be able to hear the station. At some point the signal will go off the bottom of the screen. You can also get the same effect if you put a handy talkey on low power a couple of feet away from the 8024c with a short antenna on the 8924c.

Thank you for an excellent start!

But now then, the level shown at the top-right in dBm seems to read like -70dBm much of the time at my repeater site. As I adjust the reference level this changes. Understanding that it is a "reference" level suggests that it is somewhat arbitrary.

More to the point do I add/subtract this number from the -70dBm to get a real sensitivity or noise floor? I'm having a hell of a time on our site using a Motorola repeater and dual band pass cavities. Grunge is getting through but more importantly I don't know how to evaluate what I am seeing for the noise floor.

As such do I want to set the reference level for 0 (zero) or -xdBm and add/subtract?

Thank you for your help. I'm trying to learn so much and I am finally getting the hang of the 8924c.

Topic: 1919 Message: 1922

The 8924c is not difficult to learn,but it does so much it takes lots of time. If you don't know it, the manual for it is mostly for cell phone use. However if you download the one for the 8920 it is almost the same but more for two way use. I played with one several hours a week for about 6 months before I got a good handle on much of what it would do. This is just a hobby for me as I do not work in communications for a living.

To measure the noise floor , try this.

Main screen.
1. set input to ant
2. center to frequency youwant
3. ref lev -50 dbm not that you want to, but you can change this to uVolts
4. span as desired probably less than 10 MHz or 5 MHz

RG GEN screen

1 Amplitude OFF to do so, highlight it with a press of the round knob. Press the on/off button on the keypad. Once for off and again for on when you want to turn it back on, but not now, you want it to show OFF.

AUX

1 AVG to 1 or more to smooth out the display. This is an average of how many sweeps the scope makes to give a value.
2 sensitivity Normal and 10db/div HIgh sensitivity gives about 10 db more gain, but it will be uncalibrated
3 normalize A only

Upper right of screen will have that level going from about -110 to -120 DB. This is the noise from the 8924 if no antenna is connected. You can not see anything below this signal level. You can use the AVG as above to smooth this out. This is where you read the noise floor when you connect an antenna to the 8924. It will be the level of the frequency where the marker is. You can go to the marker screen and move it where you want it to show the level.

The number you see will be where the marker pip is on the screen. It will be the -50 and the number of devisions from the top of the screen. If it is showing -100 then that is the -50 and then 5 devisioins down from the top. If you go back to the MAIN and set it to -40 the number will still show -100 db but the trace onthe screen will be moved 1 devision down. That is because the top of the screen is now -40 so you have to have - 60 to give you the -100 db as the signal level has not changed. Sort of like an old multimeter, if you dont change the input voltage, but change the range, the position of the meter needle will change.

Now plug in the antenna and see if the trace comes up some. If it does, you can read the noise floor. If it does not, and you can see some signals popping up on the screen you have a quiet location.

I think you may be seeing around 80 db as you may not have not turned off the signal generator part of the tracking generator.
Cut it off as described above and you should see the number go up (down if you count the larger negative term as going down) and the trace on the screen go down.

If you have any more questions, I will try to answer them for you.

If you have a General class ham license or higher I can meet you on the low bands and talk you through some of this.

From: wb4yjt@...
Topic: 1919  Message: 1923

You can lower the instrument's noise floor by selecting a narrower span, which will automatically select a narrower Resolution Bandwidth.

At spans less than 50 KHz, the RBW is 300 Hz
From 50 KHz to less than 200 KHz, the RBW is 1 Khz.
From 200 KHz to less than 1.5 MHz, the RBW is 3 KHz.
From 1.5 MHz to less than 18 MHz, the RBW is 30 KHz.

This is from the 8920 Assy Level Repair manual.
John K.

I may have misunderstood the question. I thought you wanted to measure how much noise there was at a repeater site from other transmitters and such. That would just mean hooking the antenna on the tower you are using to the ANT in put on the 8924c.

Using the Iso-T would make things look 30 to 60 db better which would mean almost no site noise would show up at all.

Most of the time the iso-t is used to send a signal into the transmission line to the receiver while the transmitter is on.

I have plugged the N connector directly into the 8924 and have seen all of the trees in the grass! But I didn't know what the rel. level meant or the top-right level. So you've still done well by me! I need to run a complete site noise test as well which I recall uses an Iso-T where the antenna is on one end and the RX on the other end past the duplexer and any other filters like my dual band pass cavities. They sure are sweet. One minute trees around me and the next, the lawn has been mowed! Chip Angle of Angle Linear http:anglelinear.com is a great guy and knows his stuff.

Thanks for your help Robert. I now have HP Drive working with a National Instruments PCI based GPIB card. Two more questions - HP drive wants to work with an HP based image file with the suffix .hpi. In the files section there is an RF Tools based bin file. Is this the file that you were referencing in your earlier post and is this an HP image file? Also what is the source of the 8920x modified file?

Regards

Mike

E8285A is closer to 8935 series than 8924. Try its NVRAM reset procedure:
Turn off the E8285A if it isn't already off. Press and hold down the "7" and "Increment Set" keys. Turn the E8285A's power on. Continue to hold the "7" and "Increment Set" keys until the "One or more self tests failed. Error code: xxxx" is displayed at the top of the E8285A's display. To verify that the NV RAM was reset during power up, when the call control screen is displayed, press the "Message" key, there should be a message similar to this: "Battery backed RAM Initialized. Standard RAM not Maintained"There may be something similar & specific for 8935 but haven't the time to search now. Let us know how you get on.

Thanks for the info Chris.
The key sequence did not work on the 8935 but I spent time going through the PDF manuals on line and found a sequence for clearing the Test set RAM on the CDMA version

To clear the Test Set’s RAM:
1. Turn the Test Set off.
2. Hold the Code Dom and HZ/mV keys down.
3. Turn the power on (with the buttons still held down) and wait until the initial power-up screen is displayed.

I have the TDMA version and can't find the Code Dom key (maybe a brain freeze for me)

Anybody know the keys to hold on the TDMA version?

Thanks Jim

Hi Rix,
You can download the manuals from the Keysight (Agilent HP) website.
First thing to check is has someone programmed an offset in the configuration screen.

Robert G8RPI.

Thanks for the rapid reply.
From what I've seen, no offset is programmed in the config screen.
From what I recall no old manuals were available from HP and we had to generally rely on third party vendors. I'll give keysight a shot
thanks again

From: Ralph Mowery
Topic: 1931  Message: 1935

Have you hooked up an antenna and checked the frequency against WWV at 10 or 15 MHz ? Mine will show 15 and all zeros.

How far is it off at 450 MHz and some other places ?

There are several places to download the manuals in PDF . If you don't know it, down load the 8920 manual as it is very similar to the 8924c. Most of the 8924 manual is for the cell phone while the 8920 is mostly for general usage.

Did you look in the files section here for the manuals ?
I think you can get the PDF from Agilent at the web site.

I have several of them in PDF if you can not find them anywhere.

The service manual runs about 12 meg.

From: Donald Forshee
Topic: 1931  Message: 1936

My 8920A will do that if the FM Coupling is set to DC and the unit hasn't been zeroed for a while. Setting the FM Coupling to AC or initiating the DC FM Zero at the bottom of the RF GEN screen fixes it...

I just discovered the output on my 8924c
rf generator is about 3kc lower at
144.The master oscillator(10mhz) is well
within 1ppb but the out put frequency remains the same with
using both internal and external time
bases.Manuals on order but I would like
to be able to attack this before they arrive either the
Saturday or Monday.Thanks

Don
I just tried your suggestions but no joy. Digging a little deeper, I have tried both the internal master oscillator and an external oscillator(trimble thunderbolt) and got the same results. The internal is set to better than 1ppb.
Leaving the link cable from 10 mhz oven ref out to ref input off, I get the unlock alarm but the rf gen output freq stays the same.
Does this possibly mean the circuits that select the reference oscillator are not picking up on it and running off another oscillator that should be locked to the reference.\\
Obviously I have a lot to learn about the box but it sure is worth whatever you pay for it. I had no idea I could do just about every test possible on a transmitter or receiver by punching a few buttons and spinning a knob or 2.
Mine is limited to 60w continuous.
Thanks all for you help.

Ralph
Thanks for the manual offer. Hopefully mine will be in shortly.
I was able to dnld a 8920 manual from mods.dk but the test names are different.
Also did some more checking and found the gen is off by about 26ppm from 10 meg on up regardless of the internal/external reference oscillator. I just hope I don't have to replace any boards. I'm trying to save up enuf to have it re-calibrated. Last time unknown.
Thanks again

Hi Rix,
Are the receiver and frequency counter also off?
Is the 10MHz Ref output (rear panel) off? This is the output of a separate 10MHz osc on the A15 card that is phase locked to the 10MHZ reference. If it's not locked you will get odities. Get the 8920 assembly level repair manual 08920-90168 and component level repair 08920-90107 from the Keysite website for starters. The main modules are the same as the 8924. The 8924 assembly level repair manual (ALRM ) is not so detailed.
I suspect a A15 module fault.

Did you know you can also do swept response measurements, scalar analyser style with the 8924?

HTH.
Robert G8RPI.

There are some differances in the 8920 and 8924c, but they are mainly the same. If you don't know about Amtronix, go here and look around for a while. They seem to be the go to people for those service monitors.

Bob
Checking the ref output against a RB osciallator and Trimble thunder bolt its right on. IE close enuf for our work.
Causing the ref to unlock makes for no changes in the frequency being measure. 10mhz, 100mhz and 144mhz. all appear to be about 26ppm off.
Did you know you can also do swept response measurements, scalar analyser style with the 8924?At the time this is way beyond my pay grade:-)
I've checked one thunderbolt against another and they agree. Software reports each is within <200ppt. I am not patient enuff to check the phase shift times between the two.
Looks like I have to give amtronix a call to ship it to them. First I have to find if I can get a packing box from them. The local UPS wanted 250bucks to ship to south jersey.
Thanks
Rix

Hi
I hope that this question is OK to ask in this 8924 forum.
I have a 8920A with the 60 watt input and would like to upgrade it to the 100 watt input, I found how this was done on the 8924 but not on the 8920A, have anyone done this and if so what need to be done and how do I calibrate the 8920A when done ??

Michael, OZ2ELA

# 1943. Re: 8920a 100Watt mod ??

From: jyelmgren@...
Topic: 1942  Message: 1943

You have two ways to do this.
1. external attenuator and change the offset from 0 to whatever value you end up with in the configuration screen. You can set the gain or loss on all of the RF ports to adjust for external devices and cabling.
This is the easiest and cheapest approach and maintains the lower power option.

2. Replace the internal attenautor ...you would have to get the full assembly since you need the calibration information on the older style SRAM card. The 8920B and 8924C use a PCMCIA SRAM which is relatively easy to edit and you could just replace the internal attenuator hybrid with a 20db 100Watt version.

You did not state which version or power level you had ....believe the standard was 60W on the 8920A but there may have been low power options on the 8920A that essentially removed the whole RF/IO attenuator assembly

HP 8920A option 016, 100 Watt input uses a 16dB chip attenuator and need to be calibrated when this is mounted I just don't know how.

The option 008, 6 watt input uses a 4dB attenuator.

The option 007, 2.4 Watt input has no attenuator.

I have not had the time to measure the standard 60 Watt attenuator yet.

on the 8920B you should be able to follow the 8924C procedure to replace the hybrid and correct the calibration. It does require you have a PCMCIA SRAM card and a PC with a PCMCIA slot so you can edit the card and run the cal procedure.

The issue on the 8920 may be the complete lack of the RF I/O attenuator assembly on the low power option forcing the acquisition of the complete assembly and not just the correct hybrid.

You still have the option of going the external route regardless of installed option or version.

Have you tried Amtronix ?  They listed some, but they may have been the 60 watt version.  I think they are about $ 350.
If you have the very low power version, you probably will have to have the whole heat sink replaced.  I think the 3 watt and up version use the same heat sink so mainly the atteunator is all that has to be changed, then reprogrammed.

Ok I see it listed on his site. Will reach out to him and see if he actually has some in stock, either the 60w or 100w. Yea my 8920B has option 007, which is the low power version, 1.2w(4w) attenuator, so yea, I'll have to have the entire heatsink replaced. I've been told this is something fairly easy to do along with the reprogramming.

Thanks for your help.

# 1952. Re: Re[2]: [hp8924] Re: 8920a 100Watt mod ??

Yahoo group: hp8924
Date: 2014-11-19 16:36:43 UTC
From: Ralph Mowery
Topic: 1942  Message: 1952

I replaced just the attenuator chip in my 8924 from the 3 watt to the 60 watt version. That was not bad at all except for about 100 screws to be removed and installed. I had to remove a few more and a cover to get to one that I dropped inside the unit. To install from the one without the high power heat sink you may have to install a couple of pieces of hardline. The programming is not bad at all if you have the program on a card. I think you have to flip a switch or two inside the unit to get it in the programming mode.

Ok I see it listed on his site. Will reach out to him and see if he actually has some in stock, either the 60w or 100w. Yea my 8920B has option 007, which is the low power version, 1.2w(4w) attenuator, so yea, I'll have to have the entire heatsink replaced. I've been told this is something fairly easy to do along with the reprogramming. Thanks for your help.

Have you tried Amtronix ? They listed some, but they may have been the 60 watt version. I think they are about $ 350.
If you have the very low power version, you probably will have to have the whole heat sink replaced. I think the 3 watt and up version use the same heat sink so mainly the atteunator is all that has to be changed, then reprogrammed.

I'm a bit confused. What's this chip that everyone is referring to?
Bare with me all, I'm new to the 8920B and new to service monitors. The
8920B arrives today actually.
The upgrade to a higher power input from what I understand is an
attenuator, heatsink and the pcmcia card for reprogramming. So what's
this chip everyone is referring to?

Thanks

Topic: 1942  Message: 1958

While this is not the exact 'chip' it is very similar looking and acting item as shown on this ebay number.  There were several differant values used depending on the input rating of the unit.  HP made a retro fit kit containg the necessary parts and a sticker to put over the input N connector.  I guess that the word 'chip' is just being used to describe the atteunator  resistor thing as it is about as big as a postage stamp and thick as a nickle.  That part can be changed out instead of the whole heat sink if going from the 3 watt unit to a 60 watt unit rating as the heat sink part is the same.  YOu just change that and reprogram for the amount the atteunator is rated for.

If you look here you can see the heat sink.  The 'chip' goes in the small box on the top of the heat sink. YOu can use one of the atteunators not for the 8924 series, but you have to change the value on the programming card.  There are files in the file section telling how to do this.
Some units came from the factory with out the heat sink (think it is the 007 low power option) and rated for about one or two  watts.  Starting with the 3 watt units there were heat sinks.  They can be over powered by a small amount for a short time.  The 60 watt unit is for 60 watts all the time , but you can run 100 watts for about 20 seconds and the let it cool off for a while.  If you over power the unit, an alarm will sound if it is set that way.

Ebay number 111491436943
Ebay number 371192509629

I'm a bit confused. What's this chip that everyone is referring to? Bare with me all, I'm new to the 8920B and new to service monitors. The 8920B arrives today actually. The upgrade to a higher power input from what I understand is an attenuator, heatsink and the pcmcia card for reprogramming. So what's this chip everyone is referring to? Thanks ------ Original Message ------From: "'Gerald Bishop' gsbishop@... ☐ 100 watt chip is about 30 bucks

----- Original Message ----- From: mailto:ku4pt@...%20[hp8924] To: hp8924@yahoogroups.com Sent: Wednesday, November 19, 2014 10:48 AMSubject: Re: [hp8924] Re: 8920a 100Watt mod ??

Have you tried Amtronix ? They listed some, but they may have been the 60 watt version. I think they are about $ 350. If you have the very low power version, you probably will have to have the whole heat sink replaced. I think the 3 watt and up version use the same heat sink so mainly the atteunator is all that has to be changed, then reprogrammed.

This was great information Ralph. So since I have the low power unit which does not have the heatsink apparently, I would have to obtain a heatsink from say a 6db unit, then retrofit in one of the higher powered "chips", install and then reprogram the service monitor.

Which begs the question. Why go through all that trouble when instead one could use an external attenuator and set the attenuator value in the configuration screen of the 8920b?

Thoughts?

Thank You all

Topic: 1942  Message: 1960

It is a lot of trouble and money.  When I bought my 8924 someone was selling the atteunator 'chip' and a factory sticker and loaning the memory card with a program on it for about $ 150.  Have not seen that on for a while on ebay.Took me about 2 hours to do the conversion, but I took a few pix of the unit while inside.  I did use an battery powered drill to twist out all the screws and put them most of the way back in.  That is counting dropping one of the screws down inside the unit and getting it back out.
I did mine for two reasons.  Did not have a 10 db attenuator and wanted to help protect over powering the thing as I usually test out  up  to 100 watt transmitters. Every bit of dummy proofing I can get helps me.. Did not want to have to drag around another piece of equipment when I go to a repeater I help keep on the air.
You can get one of the generic "chips" off ebay and put it on a heat sink and if it is a 10 db pad or just buy a 10 db 100 watt unit , just remember to move the decimal point in your head.

I've decided to forego the idea of upgrading the HP itself and going
with an external attenuator instead. I'm now actually thinking of just
building my own external attenuator (homebrew).
Heatsink housing, 20db attenuator chip, couple of N connectors, thermal
compound and some 50ohm coax(RG-142). Should be able to get it done for
around $50.

Thanks for all the help

Yes, a 20 db attenuator would be a good way to go.  I said a 10 db, but that is not nearly enough where a 20 db would let you move the decimal place 2 places in your head or you can set the offset in the start up menue.  You may want to use BNC connectors instead so you can use some rg-400 cable.  I put a BNC to N adaptor on  my set and leave it on all the time.  Saves wear and tear on the connector on the test set and if it wears out, can be replaced very easy.  I just wish the other two connectors on the set would have been N type also.

There are 20db External attenuators that support high power for pretty reasonable prices.

Not really worth the hassle of building one to get a consistent level across the full band

Yea I've seen a few reasonably priced ones already. I'll probably end up buying one and building one(for fun).

# 1965. HP7835 RF tools

Yahoo group: hp8924
Date: 2014-12-04 13:08:31 UTC
From: wallydoc@...
Topic: 1965  Message: 1965

I am considering buying a HP 8935.
How do I tell if RF tools are included?
Do I need the PCMCIA card or is the program loaded?
If there is a RF tools screen does that mean tools are set up?
Any other things to consider?
Thanks for any advice.
Wally KC9INK

From this page it seems the 8935 has the RF Tools built in.  If the screen comes up , then it does.  This is just the software and you will have to have a RLB and another combiner to make use of all the RT Tools functions.

Hi Wally,

The 8935 has RF tools resident in ROM. The RF Tools screen comes up when the feature is invoked.

You will need two accessories: an RLB for swept return loss measurement, and a resistive (not transformer-type) combiner for cable fault testing. I have the Mini-Circuits ZFRSC-2050-N and the Amtronix SW2012N. You will also need a precision 50Ω 1W termination (Narda or similar.)

# 1969. HP8920A Help

Yahoo group: hp8924
Date: 2014-12-12 10:54:32 UTC
From: sanjaya_t@...
Topic: 1969  Message: 1969

hello thanks for let me joining in this group
i just got a HP8920a in the local auction in my country
the instrument is have a problem some time the display want to turn on and sometimes don't
i've checked all the power supply output voltage and its seem to be okay all the output voltage it's normal
when the power is on the speaker make a sound Hisss and beep after about 5 second and then became a hiss noise again... when the power off the crt screen only just blinking for a second
the 4 led indicator inside just turn all on...
i've download the assembly level manual and try to figure out what happen to may service monitor and it's seem dead end ....
but some time the service monitor just turn on suddenly and working just have a spectrum analyzer eror 242 but all the other function is working fine
maybe any one can help me or i hope some one have the HP8920A that can i ask a few think to compare and share... thanks all

best Regard
sanjaya

My 8924 recently experienced an Error 242, and after much troubleshooting the problem turned out to be a defective module A32 (P/N 08920-61852). Replaced the module and recalibrated - now everything is good.

Hello and welcome:I had similar problems with entirely different HP equipment and spoke to a real HP repairman. He said to wash the boards with isopropyl alcohol (rubbing alcohol), make sure that the plug in spots are clean. He said it was surprising how this simple procedure could help. If the problem is dirty contacts this could help.He said use isopropyl because it does not contain water, ethanol does.Other folks will tell you to use deoxyit or other spray cleaner, iso is cheaper.I really do not have any experience with your particular unit, but this procedure has helped multiple problems on old equipment.Wally, KC9INK

# 1972. RE: [hp8924] HP8920A Help

Yahoo group: hp8924
Date: 2014-12-12 14:25:24 UTC
From: Mike (WM4B)
Topic: 1969  Message: 1972

Do NOT use Isopropyl alcohol from the drug store as it may contain additives such as salts. Go to Lowes and buy a can of isopropyl alcohol if that’s what you choose to clean with. Dispense it into another container before cleaning…. do NOT dip your brush into the can. Keep the can sealed tight when you're not dispensing... it will collect water from the air very quickly.

That being said, I would definitely choose DeOxIt over alcohol. Alcohol is a solvent…nothing more. DeOxIt, as the name suggests, will remove oxidation and condition the contacts. There are similar products that work well too. Yes... they are expensive, but you won't use very much and they are worth the money. If you’re going to go to the trouble of tearing it apart to clean it, why not do it right?

You seem to have two problems. I suggest looking into the power supply circuit to see if there is a keep-alive or standby voltage that may be drifting or dirty; IIRC, the -8924 has a similar issue related to the power supply. Don’t waste time with the Error 242 until you fix the first problem.

YMMV,

Mike

# 1973. 8924C Power Supply

Yahoo group: hp8924
Date: 2014-12-14 05:34:05 UTC
From: wb6dgn_tom@...
Topic: 1307  Message: 1973

I think the electrolytics in my 8924C's power supply are dying.
When I start the instrument cold, the unit will start to boot and the display shows the couple lines of text at the top left as normal. Then, when the splash screen comes on (drawing more current) the display goes blank and the fan stops for a few moments, then the display comes back and the fan starts. This sequence repeats a random number of times until the machine completes the boot cycle (obviously, not all voltages are going down) and then the machine runs normally (at least, right now).
When the oven is allowed to warm up before turning on the instrument, the instrument boots and displays normally as if nothing is wrong.
So...I'm guessing that the part of the supply that supplies the oven and the display has some aging capacitors; probably excessive ESR, which is causing the issue.
In any case, my question is; "does anyone have a list of the capacitors that should be changed so I can order them before I take the instrument apart. Right now I can still use it IF I let the oven warm up first and THEN turn on the unit. 'Course, not sure how long that's going to last.
So...if anyone's got values and/or part numbers as well as a recommended source (I prefer Mouser if possible), that will keep me from having to dismantle it and have the pieces lying around until the parts come
All suggestions and advice greatly appreciated!
Tom

From: Ralph Mowery
Topic: 1307  Message: 1975

That is similar to what my 8924c was doing.  It just would not do anything unless I plugged it in for about half an hour before turning it on.  Replaced the power supply module with one from Amtronix and it now comes on when fiirst plugged in and the power switch is pushed.
I hope you have a power screwdriver as there are lots of screws to take out.

So...I'm guessing that the part of the supply that supplies the oven and the display has some aging capacitors; probably excessive ESR, which is causing the issue.
In any case, my question is; "does anyone have a list of the capacitors that should be

changed so I can order them before I take the instrument apart.  Right now I can still use it IF I let the oven warm up first and THEN turn on the unit.  'Course, not sure how long that's going to last.
So...if anyone's got values and/or part numbers as well as a recommended source (I prefer Mouser if possible), that will keep me from having to dismantle it and have the pieces lying around until the parts come
All suggestions and advice greatly appreciated!
Tom

# 1976. What should I do with my 8924E?

Yahoo group: hp8924
Date: 2014-12-14 14:13:57 UTC
From: wpxs472@...
Topic: 1976  Message: 1976

A few years ago, 8924s and service monitors in general took a big dip in price on eBay. I had an old Marconi that was getting terribly long in the tooth. So, I bought an 8924C. Shortly thereafter, I saw another 8924 really cheap, best I can remember, under two hundred, so I bought it. It turned out to be an 8924E which isn't very useful. So, I kept it as an organ donor for the "C". Well, I hardly turn the "C" on any more, not much radio work going on these days. Since I am getting somewhat long in the tooth too, I thought about either listing the "E" on eBay or maybe even parting it out and selling the pieces. Which would be a better way to go?

Hi,Does it have option 102, the spectrum analyser? This make a big difference. Even without opt 102 it's similar in capability to the Marconi 2955 if a little bigger :-)Amtronix sell tham for $700. Where are you located?

Well...since I may be in need of a power supply, how much do you want to get for it and, for shipping estimate, where are you located? Please contact me via eMail address below.

Ralph,
After having built a boat kit years ago with over 1400 brass wood screws to put in it, I am somewhat numb to wielding a screwdriver but, yes, I do have several power ones that I, very cautiously, use. Modern conveniences that were rare when I built the boat!

Chris,
Thanks very much for the list. That'll be a big help. Did you use Low ESR types or run-of-the-mill caps.?

Well, I don't really know what it is worth. The last time I fired it up, it booted OK and the screen seemed a little better than my "C" model. I live in North East Alabama. If I were to part it out, the shipping for an assembly wouldn't be all that much. It doesn't have option 102. My "C" doesn't have it either. A spectrum analyzer isn't something I use a lot. It does come in handy when you need one though. If I were to sell it whole, shipping would be a pain. I wouldn't ship it in a way where it might get damaged and doing it right isn't easy, but if that is what it takes, well.

The 8924c had the the spectrum analyzer option standard which also includes the tracking generator.

The tracking gen is a lot more flexible than most.

Should be there unless someone pulled it and installed the terminator card in it's place.

I have an 8920B and have 11807E software that I had previously moved to
a PCMCIA SRAM card. Unfortunately once again, the SRAM battery has died
I have since changed lap tops, and I cannot find a PC program to
transfer these files to the card. I would like to transfer to PCMCIA
FLASH card, but cannot figure out how to do it. Also, I need help
determining compatible FLASH cards. I posted this problem a while back and was promised
detailed instructions on how to do this but never heard back from the individual.

Better yet, perhaps there is a specific PCMCIA (slot) to CF SD (card) adapter that would
solve this problem for me. If anyone has been successful using this method, please share,
because I would prefer to avoid PCMCIA cards due to difficulty in supporting that format.
Any help here would be much appreciated.

Joe;
Actually I have long been following all the threads on this subject and there is no comprehensive tutorial of the subject as far as I can tell. I am prepared to buy "off shore" but prefer to have techniques available to me. I am just funny that way. Example: Despite Stereo Studio's great service department, I insisted on having schematics for my brand new Denon power amp in 1976 and low and behold in 1985 after I moved far away I had to fix it with a $4 regulator transistor!

I have loaded my SRAM card in the past so the concept is not foreign to me. The problem, I am having is with the FLASH and I am slowly learning but still have gaps.

1) The FLASH must be linear type and if it has a 12V write/erase, requires a PC with compatible adapter to write to it. The test set does not care when reading the card if the read voltage is 5V. I will still need my SRAM to write data FROM the test set.

2) The test set expects "DOS" or LIF formatted media. In past I have initialized my SRAM using the facility of the test set. Because the test set cannot write 12V to FLASH it cannot be initialized. This raises the question how to format to "DOS" that is expected by the 8920B using WIN XP? FAT, NTFS??? This may be the problem I am having. Especially since WINXP does not seen to see the uninitialized card and assign a drive letter.

3) I have a pile of PCMCIA FLASH cards, many are ATA, those I will put aside. The others were pulls, probably from routers and I can only assume they are linear, but the voltage is unknown. If I were to buy a linear FLASH card, what nomenclature would be best to look for?

4) I have MCE installed on an old COMPAQ computer, but have had little luck in copying files. It seems I cannot write to the cards.

So yes, despite the many threads on this now difficult to search yahoo-neo group, I am still stumped and still want to make it work.

Hi,Your problem is almost certainly that the Compaq computer does not support 12V programming properly, if at all. As you have said, ATA cards (and CF in adaptors) will not work. While the 892x only uses 5V, the only FLASH cards I have found to work are "raw" 12V ones. 5V ones (including those with on-board 12v converters) don't seem to work. As HP never published the specification for the cards it's hard to be sure exactly why. I have about a dozen PCs with built in PCMCIA slots, mostly laptops, ranging from a $10,000 mil-spec unit to simple 386's. Only two of these will program 12V cards. I bought a second back-up laptop of one of the models that worked, but dispite the same model number, it won't program 12V cards. The other option is to buy an ELAN linear PCMCIA programming adaptor. The external ones are expensive and ELAN have gone out of business. If buying an internal adaptor, make sure it is a full function one. Many of the internal adaptors on sale are "stripped down" versions that were designed to allow PCMCIA network cards to be used in desktops.  Many of these won't even read a memory card, never mind program 12V Flash. Anyone want do buy a box of programming adaptors and PCMCIA cards that are guaranteed NOT to work :-)

Happy Holidays,Robert G8RPI.

Hi Wally,

I also have an Agilent 8935 which is like new. Your Marconi SA has one advantage over the 8935; its minimum RBW is 3 Hz, whilst the SA function in the 8935 has 300 Hz minimum RBW. Thus, I would recommend that you hold onto both instruments.

You can purchase the accessories individually. Amtronix have an excellent RLB, Model SW2012N. These, as well as the Eagle equivalent, sometimes show up on eBay.

http://www.amtronix.com/

A less costly alternative, although not as accurate, is a Mini-Circuits (MCL) ZFDC-20-5 directional coupler with N fittings. The MCL ZFRSC-2050-N is a suitable resistive splitter. You can also order N-type attenuators and terminations from MCL.

Hi, An original NEC MultiSync, if you can find oneAlternatively you can use a scan converter which will drive a standard VGA/SVGA monitor. The Gonbes 8200 (or 8220 which will drive two monitors) is one example. It's a bare board, not plug and play. You need to make up a sync separator, either a LM1881 chip (no adjustment) or a comparator and preset pot. Search the group for Gonbes. These boards were designed for converting old arcade games to LCD VGA screens. There are many sellers on ebay. You can buy plug and play solutions that come boxed up but they cost more. Search for CGA to VGA converter. Ebay item 321299448184 looks like it will be OK from the spec, but I've only used the Gonbes personally.
What frequency range and performance do you need from your rf bridge?
Robert G8RPI.

This converter is suspose to work with the 8924c. but I have not tried it.http://www.moncotech.com/cnc.php

I use a RLB like this from Mini-circuits.  They are less than $ 100.  Compaired it to the more expensive units and it seems to be plenty good enough to tune duplexers.  They also make a resistive coupler but I don't recall the numbers on it.
Using the 8924 with a Mini-Circuits ZFDC-20-5 to measure return loss.
The first thing to do is to configure the 8924 for "duplex out" and"antenna in"and set up the tracking generator for no offset. To measurereturn loss hook the "duplex out" on the generator to the "out" connectionof the directional coupler. Then hook the "antenna in" port to "couple" ofthe directional coupler. You can now establish the base line on the spectrumanalyzer as this will show infinite SWR or minimum return loss. It shouldread about 20 db less than what you are generating. Once you've done thisconnect the load or device under test to the "in" port of the coupler. Thespace under the base line on the spectrum analyzer is the return loss innegative db. (Note: this may be counter intuitive to some but we're usingthe directional coupler to measure what's coming back as apposed to what'sgoing out which is what the labels on it are for.)
I have found some low power dummy loads on ebay that are rated for a very low RL.  Usually a
BNC or N connector.  They may also be called 50 ohm terminators.  Just make sure they are rated for a low RL and not just general terminators.

Hi Wally,

Excerpt from the 8935 E6380 Reference Guide, p. 292:

VIDEO OUT
This connector provides a signal for using an external video monitor. The signal provides a duplicate of the Test Set’s screen.

Operating Considerations
The CRT’s Video Output drives a multisync monitor at 19.2 kHz (analog). Examples of this type of monitor include the Electrohome ECM 1410-DMS 14-inch color monitor and the EVM 1242-P4VID 12-inch monochrome monitor.

The Mini-Circuits parts I mentioned in my previous post will work quite well with RFTools at reasonable cost. You can often find these components on eBay.

Hi Robert,

Do you have a drawing on how to hook the 1881 chip to the 8200 converter board ?
I looked in the files area and all I saw was for the other type of sync seperator chip.

Hi Ralph,Use the circuit from fig 1 of the LM1881 data sheet http://www.ti.com/lit/ds/symlink/lm1881.pdf connect the LM1881 video input (0.1uF to pin 2) in parallel twith the 8200 video input. Composite sync (pin 1) to the 8200 H sync input, Vertical sync (pin 3) to the 8200 V sunc input. HTH,Rbobert G8RPI.

Thanks Robert.  I placed an order for one of the 8200 boards and some lm1881 chips.
 Probably will take a couple of weeks to get here form China.  So far I have had good luck with the small items from China.
I don't get into building any big things, but do like to put together some small things that have less than 20 parts in them.
I did a quick read of the chip and it seems that the resistor has something to do with the sync rates (whatever they are called).  Did you change the value or just use what is on that data sheet ?  I have a good general back gound in electronics, but video has never interisted me.
I know what I have been told about the shipping and their government, but still do not see how they can even ship things here for what they do.  Not sure what it costs where you are, but it costs $ 1.10 to get a stamp just to send a letter out of the US to another country, and fourty some cents for a first class letter in the US.
thanks,and 73de Ralph

I am using a old black & white teleprompter monitor. I am in Montana until next weekend and don't remember the
brand. I just adjusted the Horiz osc coil for best lock. I had to change a capacitor in the Horiz osc to
move the lock toward the center of the coil. The vertical had plenty of range.

# 2005. E8285A setup

Yahoo group: hp8924
Date: 2015-01-12 18:10:16 UTC
From: N1BUG
Topic: 2005  Message: 2005

Hi,

I have been lurking here for a while. I am still getting to know my E8285A and have a question.

I am using an outboard 30 dB attenuator so I can check transmitters running more than the 2.5W input limit of the E8285A. This of course works fine but every time I turn the unit on I have to go into Setup to toggle RF Level Offset to ON, and enter the offset level (-30.5 dB measured) for RF Input. If there is a way to save this so I don't have to enter it every time (without messing up other things, such as the unit being configured to come up in analog mode each time) could someone tell me how to do it?

I don't know about the 8285, but as it is similar to the 8924 you might try this.  Set it up the way you want it, then store it as the POWERON setting.
To do this, go here and follow the step #4 after you get your 8285 set the way you want it to power up as.
poweron

|  |
|  |  |  |  |  |
| poweronMake your HP 8924C Turn onlike an 8920B Whenyouturnontheunit, the RX test screen should appear on the display afterthe“8924C” screen. |

Hi Paul,Welcome. This is based on the 8924, but it's worth trying on the E8285A.  The test set will store configurations. If you name a configuration "POWERON" it will be loaded at power on. Set up the test set as you want it then press the Blue Shift Key, then the Store Key. Use the main scrolling knob to select the letters  POWERON, one letter at a time. Scroll to the top and  select  “Done”. This completes the POWERON setup procedure.

Yep, if I remember correctly it works the same on the E8285A. I will also mention that you can store the setup under another name, and recall it easily, but it won't come up at power on.

I thought it would be the same as the 8924 or very similar.  You should be able to set the 8285 most any way and save it as POWERON  and the next time it will come up that way.  You can also set it up for other ways and save it under a name of your choice and recall it the same way.  Makes it easy to have your most common setups in memory.Anytime you want to you can recall those setups in the same way.
When the set first comes on it boots up in the standard mode for it, but will check to see if you have saved a setup as POWERON.  If so, it comes up in whatever was saved as poweron. Becareful and don't erase those memories.  No harm will be done, but you will have to enter them in again if you want to.  If you do not want it to come up with the poweron setting, either delete it or just rename it if you want to save it for later use.

Robert the chips and board came in today.
Took about an hour or two to get my stuff together and lay it out on the work bench.  I could not resist and just plugged it in the green phono connector.  As others noticed the left side of the screen was missing the first part.
I then built the sync board and could not get a display at all from the 8924c to the vga monitor.  After trouble shooting for about 10 minuits, I noticed the yellow wire from the horizontal sync on the connector was in the wrong place.  I moved it over one space to the correct position and after doing some adjusting on the monitor and board to get the screen center it works fine.
Now all I have to do is find a box to put it in.
Thanks for the help and info.

Right side of the screen near the bottom, select "analog". A drop down will open, select "scope".

You may have to change the vertical input source from FM Demod,

Hi Paul,I only have an 8924C, but here goes. 1/ Using the main knob, scroll around until the circle next to "Analog" on the Right side of the screen is filled in. 2/ Push the knob in. 3/ Scroll down the list to "Scope". 4/ Push the knob. That should get you to the 'scpe screen. HTH,Robert G8RPI.

.

# 2019. Low power limit of 1 watt on 8935 for 30 too 100 MHz

Yahoo group: hp8924
Date: 2015-01-23 16:56:57 UTC
From: abrigno@...
Topic: 2019  Message: 2019

Just got an HP 8935 test set and I am getting familiar with it. Noticed that for Rf power measurments that in Data sheet August 14, 2001. That for RF power measurements it says the range for 30MHz to 100 MHz is 4mw to 1 w continuous. Is this correxct? Am I missing something here? 1 watt continuous seems low?

Excuse typing I have the famous Yahoo white box in the center of my screen and have to work around it.

# 2020. 8920B Firmware

Yahoo group: hp8924

From: rtatis@...
Topic: 2020  Message: 2020

Hi,
Is there a compiled list anywhere that shows a change log of the firmware versions for the 8920B?
My service monitor has B.01.25 and I'd like to know what if any improvements there are with newer firmware and subsequently how to obtain a newer firmware already on a PCMCIA card.

Thank You

Hi,Interesting, That's what it says, but according to the block diagrm the first item connected to the RF IN/OUT port is a 16dB 100W attenuator so It's not clear what the limitation is. Amtronics say it is good for 75W 100% duty cycle. I can't actually find a formal specification for the 8935, it's document no. 5966-0512E but it's not on the Keysight website.
This note on power measurement
http://literature.cdn.keysight.com/litweb/pdf/5967-5539E.pdf may be useful.
What does it say on the box (side or near RF IN/OUT)?

I believe that these are link their predecessors in that there are low power and high power versions. The low power versions were focused on handset production and repair. I do not remember which was default and which was the option.

Here is a link to the data sheet.
http://literature.cdn.keysight.com/litweb/pdf/5968-3798E.pdf
http://literature.cdn.keysight.com/litweb/pdf/5968-3798E.pdf

RF measurements it show max continuous input power of 1mW to 100w <40 deg C. Derating to 75w cont <55 deg C.

Pop the hood and see if there is a big attenuator on the input port.

The low power max ratings are for CDMA and TDMA signals where there are multiple 15w channels and it's monitoring all of them. My take

Hi Cliff,I agree on the multiple carrier case, but under RF power measurement the datasheet says
"30 MHz <fc<100 MHz: 4 mW to 1 W continuous"While above 100MHz it's 100W below 40degC.The only obvious explanation s a PIN diode switch rating. They don't work well at low frequencies. However the block diagram shows an attenuator first. The other issue is the datasheet is a sales tool, I was hoping to find the performance specification, 5966-0512E, which should be definative. The other clue is the warning label next to the RF connector.

You're mixing 2 different parts of the spec sheet. The first is from the CDMA section. Here is the complete other;

RF Analyzer Measurements
SWR: RF IN/OUT Port:< 1.5: 1
ANT IN Port: <1.6:1, except <1.8:1 for 0 dBattenuation in 1.7 to 2.0 GHz band
RF Frequency Measurements
Measurement Range:
400 kHz to 1 GHz, 1.7 to 2.0 GHz
Level Range:
RF IN/OUT:
1 mW to 100 watts continuous, temp. <40° C,
75 W continuous, for temperatures <55° C
ANT IN:
−38 dBm to +15 dBm

# 2027. Re: [hp8924] Low power limit of 1 watt on 8935 for 30 too 100 MHz

Topic: 2019  Message: 2027

Hi Cliff,Sorry you are wrong, the section you quote is the accepable level range for frequency measurement. The powermeasurement section clearly has two ranges, above 100MHz (100W) and below 100MHz (1W)
RF Power Measurements
Frequency Range:
30 MHz to 1 GHz, 1.7 to 2.0 GHz
Measurement Range RF IN/OUT:
100 MHz <fc<2.0 GHz:
4 mW to 100 W continuous, temperatures <40° C,
75 W continuous, for temperatures <55° C
30 MHz <fc<100 MHz:
4 mW to 1 W continuous
Looking at the ALRG again it shows a switch contact before the power sensor. If this is a PIN switch it could account for the frequency range. It is also possible that the high power sensor has a small coupling capacitor (low inductance too, essential for UHF) at the input, rendering it poor below 100MHz. For low frequencies they may use the receiver/RF analyser for power measurement, with attendant low power range.

Robert G8RPI.

Here is the section you are quoting:

CDMA Analyzer Specifications
Average Power Measurement
Input Frequency Range:
30 MHz to 1000 MHz, and 1.7 to 2.0 GHz
Input Connector:
RF IN/OUT only
Measurement Bandwidth:
Provides an accurate measure of the
total power for signals within ±2 MHz of the operating frequency.
If other signals are present outside this frequency range, reduced
measurement accuracy will result.
Maximum Input Level:
15 W average for CDMA signals
Measurement Range:
4 mW to 15 W for f >100 MHz (+6 to +42 dBm)
4 mW to 1 W for f <100 MHz (+6 to +30 dBm)
Measurement Period:
0.25 ms to 26.66 ms

While I don't fully understand cellular operations it seems to me they are measuring the total power in a 4 MHz (+/-2MHz) window and the individual signal should be <15w avg or 1w avg. That's where it gets confusing.

Last I checked cellular CDMA doesn't operate below 100MHz.

The section I previously quoted from the same data sheet but 2 pages later clearly shows an operating range of 400kHz-1GHz, 1700-2000 MHz and a power measurement capability of 100w.

The confusion could be from the SM connected to the antenna port in a CDMA or TDMA system is seeing multiple signals and having to handle the total power whereas when operating as a SM for an individual radio it's only seeing a single signal and has more power handling capability.

Hi Cliff,The quote in meassage 7 is from page 4 of 5968-3798E and is for "RF Frequency Measurements" not power measurements.
Copy from meassage 7"ANT IN Port: <1.6:1, except <1.8:1 for 0 dBattenuation in 1.7 to 2.0 GHz band
RF Frequency Measurements
Measurement Range:"
The RF Power measurement spec is on page 5.
This indicates that the <30MHz 1W power limit is not a damage limit and seems to confirm my thought that they use a different detector below 30MHz.Please remember that 5968-3798E is sales flyer, not a formal specification. Without that specification we are just guessing.

Then why does it list a max power of 100w? Or did you fail to notice that? When checking frequency that is the max power it can handle.

Usage as a CDMA/TDMA test set and usage as a service monitor are 2 different things that's why there two different sections and sets of spec's. Don't mix the 2.

Once again;

RF Frequency Measurements
Measurement Range:
400 kHz to 1 GHz, 1.7 to 2.0 GHz
Level Range:
RF IN/OUT:
1 mW to 100 watts continuous, temp. <40° C,
75 W continuous, for temperatures <55° C

FWIW I learned more about CDMA in the last several days than I ever wanted to know, hopefully I will be able to forget it as fast as it's not something I will ever need. Service monitor usage is a different thing and I'm still learning the thing that mine can do. Amazing boxes.

Clif, Robert is not referring to the CDMA/TDMA section of the data sheet. You are both quoting from the general (non-CDMA/TDMA) section. You are quoting the frequency measurement specs on page 4, while Robert is quoting the power measurement specs on page 5. Please notice the power limits for frequency measurement and power measurement are different.

Robert, I think you meant 100MHz toward the end of your last description, as there is no power measurement spec below 30MHz. The 1W limit applies to power measurements between 30 and 100MHz.

As Robert says, 1W is not a damage limit. I think you can safely put a continuous 100W (< 40C) signal throughout the 8935 operating frequency range into the RF IN/OUT connector, you just won't get an accurate power measurement above 1W below 100MHz (frequency measurements will still be accurate however). That safe power limit is 75W for temperatures from 40C to 55C, which accounts for the 75W warning label above the RF IN/OUT connector. I hope that helps clear things up.

Concerning 8935 power measurements.I tried this 2-3 days ago, before reading this thread.I recently connected my military radio, a GRC 106 to my new HP 8935 RF IN.I wanted to see if it would measure the watt output.I found out that if you use PEAK on transmit power measurement, the reading is way high, maybe 160W? Don't remember.When I switched to SAMPLE it came up with a reading very close to my wattmeter.I was reading a 55 W tuning carrier.Frequency is 14.2 MHzBy the way frequency reading was accurate also.Also, no smoke.Wally KC9INKPlease note: no electrons were harmed during this particular procedure

Hi Steve,
Thanks for the correction, I should indeed have said 100MHz. Having done some more research I think the issue is as follows:
The main power meter circuit has to work up to 2GHz. As a design compromise (large capacitors for low frequency response have too much stray inductance for high frequencies) it does not work accurately below 100MHz. Below 100MHz the "receiver" module is used for level or power measurement. This has limited power capability hence the 1W limit. Note that this is only accurate down to 30MHz (due to the PIN diode switches in the input assembly having increased loss below 30MHz) while the frequency counter works down to 400kHz. The counter just needs enough signal to toggle the counter, it does not care about the flatness of the input circuit with frequency.

Regards,
Robert.

# 2036. RE: [hp8924] Low power limit of 1 watt on 8935 for 30 too 100 MHz

From: Tony Brignole
Topic: 2019  Message: 2036

I was the guy who posed the original question about the 1 watt input limit between 30 and 100 MHz.

I was at the Jackson MS hamfest this weekend and just got caught up.

Thanks to all for taking the time to answer and clarify the question. Lots of very good discussion. Using the SAMPLE mode technique mentioned is interesting. I have service manual but did not have time to study it prior to hamfest. Will dig into it little more this week.

At worse case I have a 100 watt 20 dB attenuator I could put in the line for measurements below 100 MHz. This would be very infrequent and not a super big deal.

I have an 8924C that works great but clearly it is a bench piece. I wanted the 8935 because it is newer and much more portable and I can take it to our repeater locations. 99% of my work is 2 meter and up. Very small amount is 6 meter work.

Far bigger issue is while I was bidding to get one, I was so successful I got 2 – nearly 4. I told her cost and Wife wanted to know what I was going to do with two expensive pieces of equipment, and the only quick answer I could come up with was “stereo”. I guess after 45 years she is used to it.

Thanks again to all who took the time to contribute.

Next big issue is what in the hell is white box that shows up in the middle of my Yahoo Groups page. It appears a lot of folks are having this problem. Need to start working on it tomorrow.

The main power meter circuit has to work up to 2GHz. As a design compromise (large capacitors for low frequency response have too much stray inductance for high frequencies) it does not work accurately below 100MHz. Below 100MHz the "receiver" module is used for level or power measurement. This has limited power capability hence the 1W limit. Note that this is only accurate down to 30MHz (due to the PIN diode switches in the input assembly having increased loss below 30MHz) while the frequency counter works down to 400kHz. The counter just needs enough signal to toggle the counter, it does not care about the flatness of the input circuit with frequency.

Regards,
Robert.

Aha! You were one of the guys I was bidding against... :-)

About the unit on lower freq, it is not going to be damaged if you put your 100W HF rig into it, the power measurement is just not accurate at all. Reads WAY high. For HF I use an IFR on my bench. Most of what I use the 8935 for is 440 and up, there its right on the money. I'll try the sample trick. But no matter what freq you are at there is still a big high power attenuator in line provided you use the RF in/out port.

George, It looked Like I was bidding against more than you. It was really jumping around at the end. At one point I had 4. Glad you or someone outbid me on two. Just got shipping info that they should be here tomorrow afternoon. Not sure what I am going to do with second one. There will probably be someone here in Memphis area who wants it.

I have had an 8924C for several years and love it. Mine is a 100 watt model and there is not much it won't do but it sure isn't portable. I was after the 8935 for the portability.

Most of what I do is VHF and up. We have 6,2,220,440, and 900 repeaters here. 6 is only one that could be problematic. Fortunately it is very little trouble. It is an old GE Mstr II. Duplexer is 4 cans 1 ft diameter 80 inches to top of can. Tuning stubs 1 ft. higher. I have to get on a step ladder to tune the duplexer. I put a commercial video adapter on the 8924 and a 19 inch VGA monitor. I can watch the monitor from the step ladder when tuning.

I want to play around when I get it. The sampling technique sounds interesting. As soon as I get a chance to get familiar with the unit and look over the manuals I may try it. It would be nice if it worked.

Clif it was govliquidation.com. It is the Ebay for the Federal Gov. I have shopped from them for years. Lately they have gotten high.

They sell everything from tanks to planes. When they do electronics it is all over the U.S. so you have to watch shipping.

I paid around $850 each for the two 8935s. There was a 16% buyers premium [up from 10%] and they charged sales tax, so cost delivered to Memphis ex Columbus OHIO was in the $1150 range.

If you live close to a DRMO you can drive and pick it up if it is in your area.

Also watch out for some onerous restrictions. Several years ago they went back and tried to get you to trace custody of everything you had ever bought. Many of these items were not special and were standard commodity items. I had most in my shop but some I had sold at hamfests. Since it wasn’t a front end requirement my lawyers suggested that they bite something. Now, on some items they make you agree to custody chain on front end. Read carefully and beware and damn sure don’t show up to pick it up in a thawb and keffiyeh.

They also follow the 15 minute rule.

I know, these are good units. I have two here now. But the prices went too high. Considering that they may be defective (I got a defective IFR a few years back this way) I figure I'd de-rate my bid to 50% of ebay market, which seems to be around $900 for anyone who truly intends to sell one there. FWIW, there are four more being auctioned starting 1/30 from the same location. Another HF 8921 as well. Same time they'll be auctioning five HP8285A's, which might be good and do sell for half of the 6380/8935 price. But the hitch is that according to Amtronix, ones badged as Agilent at some point lost the ability to work below 800 mhz, and can't be modified.

For the person who asked, these are being auctioned off by the US gov. I use Govliquidation.com which is easy to use. Before getting one of these you probably need to fill in some boilerplate forms called end user certificates, etc.

Enjoy, these are all nice units. I use mine frequently though my go-to bench unit is an old IFR-1000S, instant on, nothing to boot up.

DRMO at Huntsville Redstone Arsenal has at least a dozen warehouses 200 ft long with 20 ft ceilings and floor to ceiling shelves with electronic equipment. Sometimes it sits for years before it clears for auction. Our tax dollars at work!!!!

I have had pretty good luck by going with classification system. They generally tend to classify down, not up.

Use search to look for stuff ie like test set or spectrum analyzer and it will list them. You can also search by area and DRMO if you have one close to your house.

Not sure who is buying from these auctions on govdeals.

prices seem to go way high and there is a 10% premium paid by the buyer on top of that. Not very many details on the condition either so other than power on tests.

Not sure all of the stuff listed is gov ...some of the stuff was tagged with asset tags from Motorola in one of the last auctions.

The shipping and local sales tax forms is another hassle if you are not local as well.

didn't want to hijack the previous thread on the 8935.

Govdeals also locks the funds up front on any bids so unlike Ebay bidders have already paid for their maximum bid and there is no possibility of non-payment

Auction fess and taxes are still due if your bid wins on top of what you may have already paid.

Given all that amazed the prices for essentially parts or not working units

Well, the IFR I bought came thru with a bad power supply. I had an 1100 with a bad scope. Then two weeks after I got the one from the G I received a letter about letting them know where it was and that it had to be returned as it contains military secrets (my interpretation of the legal gobbledygook). I was able to drive it to DRMO in San Antonio. Even paid me mileage to drive it there, paid me 100% of what I paid for the unit, including shipping from Honolulu, where it was located. The DRMO guy (a ham) didn't want to believe they were recalling IFR-1100's, but showed him the letter... It had a nice canvas case, should have kept that. This last week I saw a bunch of what looked like workable Hummers in Hawaii, but the conditions were to scrap them, which has to be witnessed by someone to verify they were actually scrapped, not salvaged. What a waste, but they're used to that.

Prices have defiantly gone up since I started over 10 years ago.

It is like any auction – you have to set your limit and be prepared to get hit once and awhile. Presently I am way, way to the good but much more careful.

Generally if is classified as category A or B there is a pretty good chance it will be OK.

Both of my 8935s arrived and appear to be working fine and in great cosmetic condition. I am still feeling my way around the menus system. The units appeared to be last calibrated in 2011.

The Hartigg cases they came in are unbelievably stout. They are waist high and may be bullet proof. Cases have wheels and pull out handle along with tons of padding and cushioning inside.

Software version is A.04

Found 2 CDs inside. Both are from HP. Contents for later date one are below. Not sure I can email these PDF files as they are massive. There is an on screen operating and user guide that appears interesting. I have not had time to go into it in detail yet but could be useful. There were actually 2 CDs but info below is from later one. There also appears to be guides for units specific to Nortel and Motorola.

If you need a copy let me know and we'll figure out how to get it to you or upload it somehow.

No, that is not how it works. You register with your card and if you win the bid they send you a statement and charge your card.

All of this is spelled out in the bid rules and procedures. They are definitely in the house’s favor and the buyers premium is now 16% vs the 10% it was for many years.

Just watch and use some common sense.

The main point of that comment is that they secure the bid payment up front so there is no chance of skipping out of the deal if you win the auction.

I am sure most of us have been stuck by a non-paying bidder on Ebay were there appears to be little consequence for this behavior.

Clif, I have had pretty good luck with the UPS store. Some charge a modest pickup fee and some don't. You just have to check. They will then pack it and ship it to you and it is pretty reasonable. Just be sure and consider the fee in your bids.

The two 8935 units were 75# [very heavy] each so the total was about 150# from Columbus Ohio to Memphis. The total was $240 including a $40 pickup fee and $1000 insurance on each one. I just had 40# shipped from New Orleans to Memphis for $38 including pickup fee. Just be sure and to check and include it in your bid fee. I used to drove to the DRMO at Huntsville [Redstone Arsenal] and pick my stuff up and it saved a bunch.

2 years ago at Huntsville I bought 3 100 ft. new rolls of 7/8 Heliax and 4 100 ft. Rolls of silver RG-58 and 4 500 ft rolls of RG-8X for $110. All of this was on a pallet sold as wire.

Understood about the "hidden costs". But I have 3 advantages;
1. I'm not buying to try and resell at a profit
2. I would be the end user and could pay more if it was something I needed
3. I wouldn't bid more than if I won the auction it would be like stealing

I thought you got the 8935's because they were lighter than your current service monitor? I show the E6380 at 49 lbs vs the 8920A/B at 38 lbs. The 8924 weighs in as an anchor at 59 lbs.

If those weights are correct then you got 25 lbs of packing which is good.

I have had for 3-4 years an 8924C and it is a hoss!!! It is listed in the HP catalogue as “portable test equipment”. I would hate to see what they call bench equipment. It would take a crane to unload it.

I love the 8924C and use it frequently. The 8935 is still heavy but at least you can wrestle it around.

The carrying cases are also stout. I have not seen cases as stout as these. The Govt. Routinely shipped them around in these. I can stand on the cases. They have at least 6 inches of foam inside to cradle the instrument. They are waist high, have wheels and pull out handle like a suitcase for hauling.

90% of what I buy is for my use. I only sell if get too many or something new. I did sell some of the wire at hamfests. Nobody needs 3000 ft of silver RG-58 no matter how good it is. We used the Heliax and I still have one new roll of 7/8” in the attic.

I opened up my 8921A today to check the battery. It still shows 2.9v and no signs of leakage.

For the groups information it uses a Panasonic BR-2/3A Lithium battery. It is available from Digikey under PN
P-270ND for $5.70

Cheap insurance to me.

Unless someone knows what battery is in the 8664A Sig Gen I will open it next

Thanks for the info clif.The 2/3A 3V battery also used in the 8920, 8922 and 8924 test sets. some use two depending on the version of memory board. One important note is that these 3V Carbon monofluoride cells are getting hard to find in europe. A 3.6V Thionyl chloride cell will work. The extra voltage is not an issue, it's holding up a nominal 5V cmos RAM chip. However the PCB mount 3.6V cells have OPPOSITE POLARITY to the 3 V ones. The twin pin end is positive on the 4V cell and neagative on the 3.6V. Buy the solder tag verson (not PCB) and use tinned copper wire to mount it.

Thinking out loud here. On my 8920A I know the battery maintains the custom settings I have stored.

Does it also maintain the calibration settings? If so when I replace the battery I'm going to put another battery across it to hold the settings while I change the old one.

The calibration is stored in a socketed EEPROM (U13) on the controller (A7) board.
I've made backup copies of this EEPROM that's in all of the 8920A's I maintain.
ONE has failed through the years, but in a relatively benign fashion...

Hello guy's,

I'm new owner of a 8921A...
As you said, it's good to make a copy of U13? Is it a DIP socket chip and what is the model number ? I hope my old eprom programer will accept it.

I'm in the process to overall the unit and check the calibration. I'm pretty sure the battery need to be replaced too.

The socketed calibration chip (U13) in all of my sets is a Xicor X28C256P-20 EEPROM.

My old, nearly antique DOS (E)EPROM programmer copies them without incident.

My NEW (E)EPROM programmer automatically sets write-protect on the chips which prevents the 8920 from updating during calibration. Unchecking a box in my programmer software fixes that issue...

Robert where is this battery located in hp8924C?? Can it be tested
without tearing the machine apart?? If it has
to come out, is there a special procedure?? I have really enjoyed
seeing the results of a good piece of test
equipment. I was able to turn a pile of junk into a working
repeater which I use for test purposes.

Thanks for all the help on here...

Hi Doug,There are normally two cells. They are mounted on the memory board that is directly behind the PCMCIA slot on the front panel (the PCMCIA connector is on the end of the board. You need the top cover off, an internal cover above the board off and one of the adjacent boards has to come out first to give enough room to manover the memory card out. It's getting late here I'll try to give more detail tomorrow.

I installed the new battery yesterday. I also copied U13 and saved it for reference. I didn't get in a hurry installing the new battery but didn't take a coffee break either. When it was all put back together I had lost none of the saved test routines. Evidently there is a cap on the line that held the voltage for the few minutes it took. Started it up and all is well. Now I have 2 more to do.

# 2070. HP8920A - is it possible to determine year of manufacture by serial number?

Yahoo group: hp8924
Date: 2015-02-23 04:06:20 UTC
From: Yuri Ostry
Topic: 2070  Message: 2070

Hello,

Here is one question to gurus...

Is it possible to determine year of manufacture of HP test set (particularly 8920A) by s/n?

We have one HP8920A non-functioning unit here. Tried to look for options label and seen options 1, 6 and some others but opt 055 is not listed on label. It was working, but power supply and display was swapped in the past to fix two more useful units with SA and high power attenuators.

Now I need to determine - does it have mechanical or electronic attenuator? It is not easy right now to disassemble this unit and look to input section label. All I was able to do is check for opt 55 (that is not listed), so I written down s/n (starting with 3922A or S922A, label is slightly damaged and upper part of first character is unreadable.)

I seen some note on Amtronix website, stating that mechanical attenuator in 8920A was standard until 1999 (if memory serves me correctly) and in later units mechanical attenuator was option 055.

So, is it possible to determine year of manufacture by s/n? Does it worth to try to fix it for some time by "borrowing" parts from my own test set (unfortunately, the one with electronic attenuator and not very trustworthy below 15m band) to complete HF ham radio project that need RF generator and milliwatt range power meter that is calibrated down to 1.8 MHz?

Hi Yuri,Yes you can decode the serial No. to get the date e.g. a HP 8924C has the serial like "US39063842"

US = Made in USA
39 = Manufactured in 1999 (19"39"+60) But it's simpler than that. If it's an "A" model with no opt 055 it will have a mechanical attenuator.Yes it is worth fixing. Even if you have to use an external power supply and VGA monitor (with converter) it is still a usable piece of equipment. Robert G8RPI.

The regular HP serial numbers are decoded as for example my SA has SN 3523A0xxxx. The first number is the decade starting with 60, add 3 = 90's. Second number is year. Last 2 numbers are week.

My SA was made in the 23rd week of 95
My 8920 has 3339Axxxx, made 39th week of 93

I found some notes about option 009 - electronic attenuator for 8920A, but this option was not listed in latest manuals.

By the way, I seen some strange options on lebels of some instrumnts, like 8ZA. Not sure what is it, some customization in hardware, or some sort of service contract or extended warranty...

Yes it is worth fixing. Even if you have to use an external power supply and VGA monitor (with converter) it is still a usable piece of equipment.

A friend of mine working for company that act as "system integrator". They build various electronic systems for buildings, including access control and security CCTV systems. In the past they used few types of TFT LCD monitors with composite video input. One of them was approx. 6" diagonal with 4:3 screen, designed to be installed into cutout in panel or console. This model is now discontinued by manufacturer, but they keep few in stock as replacement parts for installed systems. I plan to get one to test with 8920 video out soon.

Hi guys,

I have just purchased a GBS8200 video converter and would like to hook it up via a sync separator to provide monitor/VGA video for my 8920.

There are a few photos and a couple of PDF documents in the files section but I'm wondering if anyone has any better/clearer instructions for connecting the sync separator circuit to the GBS8200.

The instructions in the files section seem a bit vague as to what pins to connect to. Also, there doesn't appear to be any reference to the additional variable resistor/resistors on the GBS8200 board.

Any help would be welcome - Thanks in advance.

Rick

There are two different chips used for the sync separator.  Which one are you looking at ?
 I am thinking one uses just a common op amp  and the other uses a specific sync separator chip.  The one I built from the instructions used the sync separator chip.
I am also thinking that I had to move one of the wires on the plug that came with the sync separator to another pin.

Yahoo group: hp8924
Date: 2015-03-23 19:36:39 UTC
From: William Bird
Topic: 2075  Message: 2078

I just finished this build. Used the GBS8200 and LM1881 chip to build a sync separator.

There are two main steps. Build and wire the sync separator circuit to the GBS8200. And modify the GBS8200 itself.

The separator is fairly simple. Take the video feed and wire to both the separator circuit and whatever RGB Inputs you would like to use on the 8200. Then take the sync signal output and connect it to the sync input on the 8200. I used a scope to verify the sync circuit was operating correctly but this isn't necessary. I used the big pins on the 8200 and soldered right to them.

The GBS8200 needs to have some resistors added as per the photos. 50k resistors are added in parallel over the SMT capacitors as shown in the photos. And in addition to that - 33k resistors from the RGB Inputs are wired to ground in order to eliminate some "background color" on the feed. I believe instead of the 33k resistors you can also hook up a pot and than adjust to your liking. But I opted for the resistors since I had them laying around. These modifications eliminate a buildup of a DC bias which will eventually fade the image on the screen.

Is there a place where all of this is documented in a single file? I see bits and pieces, but nothing specifically about what exactly has to be done to the GBS8200.

I just finished this build. Used the GBS8200 and LM1881 chip to build a sync separator.

There are two main steps. Build and wire the sync separator circuit to the GBS8200. And modify the GBS8200 itself.

The separator is fairly simple. Take the video feed and wire to both the separator circuit and whatever RGB Inputs you would like to use on the 8200. Then take the sync signal output and connect it to the sync input on the 8200. I used a scope to verify the sync circuit was operating correctly but this isn't necessary. I used the big pins on the 8200 and soldered right to them.

The GBS8200 needs to have some resistors added as per the photos. 50k resistors are added in parallel over the SMT capacitors as shown in the photos. And in addition to that - 33k resistors from the RGB Inputs are wired to ground in order to eliminate some "background color" on the feed. Hi Mike,No I don't think it all is in one place. I'm pretty sure I was the first group member to try a GBS8200 and proved it basically worked. I used a LM1881 sync separator. Previously I had tried using various Extron converters intended for interfacing compters to projection TVs with limited success. Other members contributed alternative separator circuits and information in the additional resistors needed to prevent DC offsets. However no-one has put it all togeter as one file.

Thanks all for replying.

I'm pretty sure I've worked out the Sync separator - GB8200 interfacing, I just wasn't clear on the role and location of the additional resistors on the GBS8200 board.

There are a few photos in the files section but very little supporting information about what the additional resistors actually do.

Anyway, a big thanks to the original poster and others who have contributed for this project.

Cheers,
Rick

I added a spectrum analyzer and sig gen lately to the pile (both go up to 3 GHz). I was looking around and noticed that the output from my 8920A was 3-4 dB lower when thru the RF In/Out rather than the Duplex out port. Below 100 MHz it was close but at 500 MHz it was 3.5 dB lower and varied from 3-5 dB between 100-990 MHz.

I was comparing the output of the 8664A Sig Gen to the 8920A when I noticed it. Both were viewed on an 8594E SA. Strange. I guess when I have time I'll have to dig out the calibration info and see what can be done.

Hi,you can clear all the saved registers by,To Clear All Save Registers
1. Press RECALL.
2. Use the knob to position the cursor in front of the *Clr All* entry in the Recall menu at the bottom-right of the screen.
3. Press the knob or press ENTER. A prompt appears at the top of the screen to verify that you want to clear all registers.
4. Press YES.
Most factory defaults can be set by the instrument state keys
• [LOCAL] returns the instrument to manual control after GPIB control is used.
• [RECALL] lists any instrument setups that were saved.
• [MEAS RESET] clears the measurement “history” for all of the instrument’s measurement algorithms (such as the averaging function) to restart all measurements that are in progress.
• [PRESET] restores most instrument settings to their factory default states, (although most CONFIGURE screen changes are not affected). Instrument self-diagnostics are not run at this time.
• ADRS ([SHIFT], [LOCAL]) displays the GPIB address of the Test Set.
• SAVE ([SHIFT], [RECALL]) stores instrument setups.
HTH,Robert G8RPI.

(No endorsement whatsoever, may or may not be reputable, buyer beware, etc)

I wonder if anyone else has tips, as well as information on how to interface these cards to read/write using modern systems (ExpressCard or USB based).

Last but not least, do we know which cards are supported and those that aren't? Mostly concerning capacity.

Thanks!

Hi,The MELCARDs work OK, certainly smaller ones. I've not seen a specification for the memory card maximum capacity, but looking at the CLIP schematic for the 8920A A8 memory module, only 21 address lines are connected to the external card so the maximum addressable space is 2MB for the old EPSON cards. This is more than you should ever need and would be a safe limit for PCMCIA to maintain compatibility. I don't have a circuit for the 8920B/8924C A8 card with PCMCIA. However the basic PCMCIA interface has 25 address lines. This limits the linear addressing capacity to 32MB so we can be sure that this is the upper limit. Anything card over 32MB will use either the ATA interface or some other scheme and should not be considered useable in a 892X. Note in particular that CF cards in PCMCIA adaptors will NOT work in a 892X. Writing to these cards with modern PC's is an issue. They are addressed as a linear memory space, not a disk system like FAT. Most PCMCIA card readers only support ATA(IDE) access. The readers of choice were the ELAN units, but Elan have gone out of business. The easy solution is to pickup a cheap old WIN 98 or XP laptop and use that. If you want to use FLASH cards, that's a whole new issue. HTH,Robert G8RPI.

Robert,

Thanks for the detailed response. I believe I'm going to get one of those cards, although I'm somewhat disappointed we cannot interface easily with the SRAM (maybe somebody has worked on a micro-controller based solution? this shouldn't be too hard to accomplish, linear memory access is easy).

I found these readers:
http://www.psism.com/pcd-tp-202cs.htm
http://www.psism.com/pcd-tp-220cs.htm

They seem to fit the bill, at 79 USD one of the models. I'm not sure on Windows, but on Linux it might be pretty easy to rely on the MMC or related interface to read and write the cards directly. No specific drivers needed there.

I have an older laptop with PCMCIA that might be well suited as a donor, though, so we will see. I'm not very familiar yet with how the card storage is used and whether I would be using it often or not. Right now my top priorities are restoring the unit (broken potentiometer for volume, 25K Bourns model, linear taper, plus knob) and most likely building a vertical mounting frame with wheels so I can use the rig without taking much space on my desk.

73,
M

Hi,You need to decide what you want to use the card for. The most common use was uploading programs such as RF Tools (I can still supply this software to list members on a Flash PCMCIA card). and storing set-ups. It does not have a lot of utility for anythig else. You can download the screen using a free utility and a serial lead. See http://www.amtronix.com/8920btsinfo.htm If you want to use the PCMCIA card on a PC you will need software to access it. It's not a DOS (FAT, FAT16) formatted disk. I'd play with the laptop before investing in a internal reader.  Robert G8RPI.

Robert,

Thanks for the detailed response. I believe I'm going to get one of those cards, although I'm somewhat disappointed we cannot interface easily with the SRAM (maybe somebody has worked on a micro-controller based solution? this shouldn't be too hard to accomplish, linear memory access is easy).

I found these readers:
http://www.psism.com/pcd-tp-202cs.htm
http://www.psism.com/pcd-tp-220cs.htm

They seem to fit the bill, at 79 USD one of the models. I'm not sure on Windows, but on Linux it might be pretty easy to rely on the MMC or related interface to read and write the cards directly. No specific drivers needed there.

I have an older laptop with PCMCIA that might be well suited as a donor, though, so we will see. I'm not very familiar yet with how the card storage is used and whether I would be using it often or not. Right now my top priorities are restoring the unit (broken potentiometer for volume, 25K Bourns model, linear taper, plus knob) and most likely building a vertical mounting frame with wheels so I can use the rig without taking much space on my desk.

73,
M

Hi, The MELCARDs work OK, certainly smaller ones. I've not seen a specification for the memory card maximum capacity, but looking at the CLIP schematic for the 8920A A8 memory module, only 21 address lines are connected to the external card so the maximum addressable space is 2MB for the old EPSON cards. This is more than you should ever need and would be a safe limit for PCMCIA to maintain compatibility. I don't have a circuit for the 8920B/8924C A8 card with PCMCIA. However the basic PCMCIA interface has 25 address lines.

This limits the linear addressing capacity to 32MB so we can be sure that this is the upper limit. Anything card over 32MB will use either the ATA interface or some other scheme and should not be considered useable in a 892X. Note in particular that CF cards in PCMCIA adaptors will NOT work in a 892X.  Writing to these cards with modern PC's is an issue. They are addressed as a linear memory space, not a disk system like FAT. Most PCMCIA card readers only support ATA(IDE) access. The readers of choice were the ELAN units, but Elan have gone out of business. The easy solution is to pickup a cheap old WIN 98 or XP laptop and use that. If you want to use FLASH cards, that's a whole new issue.  HTH, Robert G8RPI.

Robert,

I would like to backup the contents (including a dump of the calibration data), so reading the card would be useful no doubt. I understood they are linearly addressed, not block based, hence why I mentioned MMC in Linux, which is used for direct memory chip access (it is the backend for SD cards, etc).
I'm interested on RF Tools. Where can I find the most recent copy? Is there a comprehensive manual somewhere?

I will experiment first with a Linux/XP dual boot older laptop and see how that fares.

Topic: 2089  Message: 2098

To reset all, go to the config screen (shift-config) then select "service" (at the botton of the "To Screen" menu...)
At the bottom of the service screen you should see "Clear all RAM and restart" (This may be firmware dependent, I have A.14.11 and A.14.14)
This procedure straightens out things that nothing else will.

Don.

Hi,There are copies of RF tools and NA FM Tests in the group files section. They are a collection of utilities that automate swept meaurements (turning the 8924C into a scalar network analyser), a scanning receiver and other functions. The manuals are there too and here http://literature.cdn.keysight.com/litweb/pdf/11807-90116.pdfhttp://literature.cdn.keysight.com/litweb/pdf/11807-90141.pdf
The programs are part No. 11807E options 001 and 100 (note that the 11807A is on a Epson "edge" card and is for the 8920A model).There is an old program "memory card explorer which can write the files to a linear card. I can supply a copy of the programs on a linear Flash PCMCIA card for $65 including shipping.

Can you write the FM tests to an Epson card for the 8920A. I have the original but want a backup. Meanwhile I will download the software and archive it. I'm wondering if the archived file could be sent to the 8920A using one of the file transfer programs? I'm not very computer literate.

If you have a blank Epson RAM card, you can copy the original program card (ROM) to the 8920A's memory, swap cards and then save it back to the RAM card.

That won't work, I've tried it. All it will copy back is the custom settings you made for individual tests. If you have a different way of doing it I would appreciate it.

Also I can't find the .bin file for 11807A Opt 001 NA FM tests. I found the 100 files.

I'm guessing the 11807 files are the same for A and B models just on a different card?

Ok, I'll download that file and save it. When you start talking about going into I-basic you are creeping out of my range. At one time years ago I was going to learn basic but other things got in the way. I think a lot of it had to do with Windoze. Much too complicated for me. DOS I could work with at one time.

I probably need to learn how to save it as I don't think the original will last forever, although it has lasted almost 20 years so far.

You don't really need to know Basic or the special IBasic.
To get the programs to work with some of the different models it needs to be eddited.  Just use a program like Notepad ot Write to open it.  It is just line by numbered line.  Go the the specific line number number and change it.  Then save the program.
I forgot about what model you have, but RF Tools worked for me on the 8924C but the NA part would not work.  Someone posted the changes that were needed and after I did that, it worked fine.

Ok, I'll download that file and save it. When you start talking about going into I-basic you are creeping out of my range. At one time years ago I was going to learn basic but other things got in the way. I think a lot of it had to do with Windoze. Much too complicated for me. DOS I could work with at one time.

I probably need to learn how to save it as I don't think the original will last forever, although it has lasted almost 20 years so far.

Hi Robert,

When I try to run NAFM from the 11807E card I purchased from you a few years ago, the program halts with the following errors:

IBASIC Error: -286 Program runtime error
Error 18 in 1380 String overflow or substring error

I also have the programs I downloaded from the group. How do I change the config file, and where do I find this file?

Hi,That is not the "EPSON" type card used in the 8920A and many HP spectrum analysers. The EPSON card has no visible contacts or contact holes. It uses an edge type contact protected by a sliding shutter. I daid find an alternative source of Flash cards in the same format and a card reader/writer. Unfortunatly both the Flash writing parameters and the reader were considered secret by the system that used them. The writer used custom software and had an embedded serial number so was useless for anything else. The application was transfer of high value, time limited information to equipment. Robert.

Hi Robert!

> But it's simpler than that. If it's an "A" model with no opt 055 it will have a mechanical attenuator.

After firing it up, it is turned out that HP8920A with serial starting from 3922A and _without_ opt 55 on a options label have a electronic attenuator.

So, maybe electronic attenuator become standard even for "A" models after some date.

BR,
Yuri

You will probably have to find an older computer,most likely a laptop.  They have a slot called a PCMCIA .  That takes special memory cards that fit in the 8924C slot.  You download the program from the files section in this group.  This can be done on any computer .  YOu then take this file and put it on a computer that has the PCMCIA slot (SRAM card).  This card looks to be about the size of a very thick credit card.  Then put the file on the PCMCIA (SRAM) card and then into the 8924C.
If you need to edit the files such as to get the FMNA program to run on the 8924C, you can use the program called Notepad.  Just open it up, change the files and save it.  Then copy it to the pcmcia card.

Must have missed the model number.  I did use the serial port to load in the program on my 8924c one time.  It took forever to do .  Forgot the baud rate, but think around 19.2 k is about the fastest.

Your best bet is to use the HPIB port and HPDIR HPDRIVE software. This does need some computer knowledge though, and you will still need a connection to the serial port and terminal emulation software to act as a console for command entry. The other option would be to build a EPSON edge card to DIL adaptor lead and use a PC memory programmer that will will write to CMOS RAM modules. There is no "plug 'n' play" solution that I know of. http://www.hp9845.net/9845/projects/hpdrive/http://www.hp9845.net/9845/projects/hpdir/ Robert G8RPI

Thanks for the help. I don't have an HPIB setup. I may try the serial port and see what happens. I do have the programming manual (never been opened). The service monitor is a tool to me, as is the software and I was looking for a way to back up the software in case of a malfunction.

It looks like what I want to do is going to require more time to figure out how to do it than I have time to spend on it.

Thanks again for everyone's help in trying to help a non computer type.

# 2122. HP8920A Audio Analyzer 2 assembly

From: Yuri Ostry
Topic: 2122  Message: 2122

Hello,

Does anyone know if there is calibration data upload necessary after A2 assembly replacement?

I just looked to assembly level repair guide, and there is two tables that have different data. Chapter 5 (Calibration) does not mention cal data for A2 at all, while table in Chapter 3 (Repair) state that cal data upload is necessaty (but only for 8920A - ?!).

I just replaced faulty A2 board (the one with variable frequency notch, opt 019) with standard assembly from another unit, and trying to figure out what to do with calibration.

Sincerely,
Yuri mailto:yuri@...

Hello,

I need to calibrate a receiver and the service manual specifies a procedure that involves connecting a signal generator to a test point and a frequency counter to another, checking the reading at the freq. counter while adjusting a variable capacitor and generating a signal at the same time. I would like to know if I can use my 8924c for this purpose and what procedure I should follow.

The other issue is: I have a 3W input attenuator inside the 8924c, and an external 100w 40db attenuator. I would like to know what's the recommended setup to test devices that output up to 100w with these components. Should I connect the rig output the attenuator, and the attenuator directly to RF In of my 8924c, or I should rather use a dummy load in parallel?

Last but not least, I have to replace the volume control pot and the RF In N-female to SMA female connector in the front panel. The former was broken during delivery and the latter has one of the inside pins missing. I have high quality replacements (new Bourns equivalent part and a quality RF connector). Should I attempt to recalibrate or do anything special before and after reassembling the 8924c? Replacing the pot should not require any recalibration AFAIK, but the RF In connector might be an issue, even if negligible, I guess.

Thank you!
Lorenzo

Ralph,

I just got two 2MB PCMCIA SRAM cards, brand is MELCARD MITSUBISHI.

Model MF82M1-77DB701. I bought them off eBay for circa 19-20 USD each, from a seller in China. Someone else was asking where to buy them cheaply too, not sure if I confused you for that person. These are 32-bit cards AFAIK, EPROM, not SRAM.

I'm looking for the instructions on how to transfer the software to the cards using a laptop with PCMCIA card reader/writer. Also any instructions for fixing the BASIC code to make the software work in the 8924C.

Hopefully I didn't acquire the wrong kind of cards. Per this thread the MELCARDs should work. It seems I won't be able to flash the updated firmware since it requires 4MB cards, but mine is 08.32, which seems more recent than the dump available in the Files section.

Oh, and for those here using Linux systems: it seems the MTD infrastructure fully supports reading these cards. Only catch is you need to write your own program to manipulate them using the MTD block devices. Should be fairly simple to do (and test, just calculate checksum or cryptographic hash with test data, write test data, then read it back, calculate its checksum/hash and verify it matches... if the driver is sane it should be a match).

http://si.org/pcmciamtd/
http://pcmcia-cs.sourceforge.net/ftp/doc/PCMCIA-HOWTO-3.html#ss3.7 (old, pre MTD maybe?)
http://www.linuxquestions.org/questions/linux-laptop-and-netbook-25/reading-a-pcmcia-memory-card-with-an-internal-reader-on-ubuntu-12-04-lts-4175484225/
http://lists.infradead.org/pipermail/linux-mtd/2011-August/037753.html

Cheers,
Lorenzo

# 2126. Vertical mount/frame for the 8924c

Yahoo group: hp8924
Date: 2015-05-11 10:57:32 UTC
From: EA5125URE
Topic: 2126  Message: 2126

A bit of an off topic, non technical discussion:

Since lab real estate comes at a premium for me, I want to mount the 8924c vertically on a custom piece of furniture with wheels.

I will likely build it so that connectors at the bottom are routed to the sides or upwards, plus include space to attach the video converter box.

I would like to know if anyone here has built something similar, and if positive, any suggestions/tips you might have for me.

Rack mounting is also an option but because of its depth, I don't think it would fit in my rack cabinet.

I'm also considering adding a serial to Ethernet port "converter" or even Bluetooth, since I network most of my equipment for remote operation and comfort.

Cheers
Lorenzo

# 2127. Re: Frequency counter and signal generator at the same time, and attenuator question

Yahoo group: hp8924
Date: 2015-05-11 11:29:13 UTC
From: Robert Atkinson
Topic: 2124  Message: 2127

Hi,Answers in line below:I need to calibrate a receiver and the service manual specifies a procedure that involves connecting a signal generator to a test point and a frequency counter to another, checking the reading at the freq. counter while adjusting a variable capacitor and generating a signal at the same time. I would like to know if I can use my 8924c for this purpose and what procedure I should follow. Yes, Use the main RF in/out connector for the signal generator output and the antenna input (on 8924C) for the counter input. The manual tells you about setting this up, but you are better off reading the 8920B (and A) manuals if you are doing analog radio testing.

The other issue is: I have a 3W input attenuator inside the 8924c, and an external 100w 40db attenuator. I would like to know what's the recommended setup to test devices that output up to 100w with these components. Should I connect the rig output the attenuator, and the attenuator directly to RF In of my 8924c, or I should rather use a dummy load in parallel? NO DUMMY LOAD, Radio output to attenuator input, attenuator output to 8924C RF in/out connector (N type)

Last but not least, I have to replace the volume control pot and the RF In N-female to SMA female connector in the front panel. The former was broken during delivery and the latter has one of the inside pins missing. I have high quality replacements (new Bourns equivalent part and a quality RF connector). Should I attempt to recalibrate or do anything special before and after reassembling the 8924c? Replacing the pot should not require any recalibration AFAIK, but the RF In connector might be an issue, even if negligible, I guess. The correct connector is HP/Agilent/Keysight part No. 1250-1811 about $50 from Keysight. Others won't fit properly. I can supply you a proper HP part (ex new equipment) for €20 plus postage. Calibration should not be an issue with the correct part. Robert G8RPI

So, simultaneous operation of both things works just fine. Nice.
What section of the manual is involved? Their indexes aren't exactly the
best I have seen.

OK (I meant Radio -> Attenuator -> T adapter to both dummy load and
8924C), but I'm happy to know the attenuator alone suffices.

/I appreciate the offer. I already have bulkhead connectors, but just in case, could you tell me the diameter of the bulkhead insertion? I believe they fit the parts I have. I don't have time right now to check carefully. I have a full front panel sent to me by the seller I got the 8924c from, BTW, so even if the new replacements don't fit I still have the exact replacement. Just need to yank it out of the other front panel. I would still appreciate it if you could get measurements, as I am sure other people here would as well.

I will post them myself when I finally get to reassemble my unit if you cannot do so/dont have the time. A quick look indicates that very few bulkheads fit, if the one used in my 8924c has the SMA nut side of smaller diameter, then I can see why most won't pass through the hole.

Cheers,
Lorenzo

Robert,

Linux MTD = Memory Technology Device. Raw access to flash/eeprom/whatever is interfaced and supported by each driver. Filesystem access is a completely different abstraction layer far above that of the device handling/IO, I know these are not treated as block devices but linear memory, which is exactly what MTD supports.

For Windows I suppose the only real problem is having driver support. Any hardware PCMCIA bus access/adapter in a laptop should work, since it is a standard. Just like modern ExpressCard is just an external PCIe bus. I found some copies of read/write software in the files section. It would be nice if people chimed in with their experiences/suggestions as to which software worked best for them, from the options available in the Files area.

Just wanted to clarify that properly. People might be confused by your statement into thinking they need a special,nondescript laptop or some such. So as long as it has a standard PCMCIA/cardbus adapter, and the operating system has the right drivers, it's pretty straightforward.

Hope that helps.

Cheers,
Lorenzo

Oh, I forgot:
http://cds.linear.com/docs/en/design-note/dn93f.pdf

As you describe here:
https://groups.yahoo.com/neo/groups/hp8924/conversations/messages/1068

The programming voltage is switchable. Again, this is a driver/software issue. Which might be the more or less problematic area for Windows users.

If I end up using Linux for writing to the cards I will send an update here when I have a chance/time permits.

Reading your previous posts I noticed the idea of building an emulator. That would be pretty great, but definitely an overkill project.
It seems doable to emulate SRAM/EPROM cards without much expense. Could probably do with a MSP430? Who knows.

People out there are writing emulated USB devices in interpreted languages running *on* the MSP430, so it's definitely possible/realistic.

Cheers!

Hola Angelo,

That's pretty neat. Thank you for the photos. I was thinking of
something a bit smaller, built with hardwood planks or MDF and aluminum
profiles.
Have you noticed any issues with the plastic legs? They seem to be the
most vulnerable part.

Stability might be an issue in my case, wheels being tucked too close
together. We'll see, since I won't be moving it much.

Cheers,
Lorenzo

Hi,Not strictly true. Most laptops do not fully implement the PCMCIA specification in respect of 12V power. Many of the linear Flash and most of the EPROM memory cards need 12V for programming (some have a step up converter built in). I have tried several laptops of various makes and models and only found a couple (a very small Sharp, and a very expensive ruggedised model) that would program all cards. While trying to find a solution to this a couple of years ago, I had difficulties due to card type, laptop compatability and software. If any one was wrong, it just did not work.
I use the Elan Memory Card Explorer software, but Elan have gone out of business.

Robert G8RPI.

Robert,

Thanks for the detailed response. To be honest I'm always rather cynical about requesting "free information" in the ham radio community when it comes to parts/etc, since there is a tendency to prioritize business above all else these days.

These are the measurements of the bulkheads I have:

Outer diameter of the threaded/insertion part: 15.77mm
Outer diameter of flat section before thread: 14.00mm
Outer diameter of the Type-N female outer connector base (flat surface, right before the rubber grommet): 20.01mm
Midsegment: 15.92-16mm
Type-N female thread part: 14.05mm
Overall length: 41mm
Inside length: (from base to SMA female tip): 20.5-20.4mm

I agree I might be better off using the part from the replacement front assembly. These non official bulkheads might fit but I can't say without checking the amount of clearance behind. 2-3mm for thread diameter difference isn't horrible if you can't get originals, but I will send an update when I get to reassembling the rig and finally check if they are useless.

Seems 29-32 USD is the usual price for the parts. This TaoBao seller from China asks for 32....
http://item.taobao.com/item.htm?spm=a1z10.1-c.w4004-254314194.22.F5Le8m&id=18467006558

Cheers,
Lorenzo

Robert,

BTW definitely confirmed the issue with PCMCIA cards is mostly drivers.
In many cases the chipset drivers wont be available for XP.

I'm about to test with Ubuntu/Linux and MTD access. I'm expecting better
results there. Unfortunately that also means no supporting software
ready for use.

Are the cards expected to be zeroed? Or do they have some basic format?

Using a VAIO portable workstation I had in storage.

Cheers,
Lorenzo

Hi,If you are using the binary images from the group files section, the cards should be erased, no format (all FF). If you have the actual iBasic programs you will need to format the cards as LIF.
Most of the laptops I tried did have the proper chipset drivers, they just didn't fit the hardware to supply 12V. The ELAN software is pretty good. Presumably becase so few cards need it. I have found some linear Flash cards that don't need it, but unless you have the full datasheet for the exact card, it's hard to tell. There are many minor variations of these cards, some such as configuration memory were used to implement data protecton so there is little data out there.
G8RPI.

Robert,

I'm testing these:
http://www.ebay.com/itm/MITSUBISHI-MELCARD-2MB-F-EEPROM-CARD-MF82M1-77DAT01-/171165979161?pt=LH_DefaultDomain_0&hash=item27da499219

Until I get to plug them into the rig, I see no luck, yet.

One potential hack would be to use serial IO to the 8924c and write the
data byte to byte if this is supported at all by the API.
I'm about to test on Linux and move on to other work today...

Found these as well:
http://www.ebay.com/itm/SRAM-PCMCIA-512KB-512KBYTE-PC-CARD-WITH-BATTERY-CSCJ-512K-SM-462-/300869038069?pt=LH_DefaultDomain_0&hash=item460d312ff5

Maybe we should put a list up of known working models.

Cheers!

Hi,The 8924C (or any 892x) can't write to Flash or (E)EPROM cards,only read them. It's not supported in hardware (on 12V) or the system. They can read or write SRAM cards.The MELCARD SRAM work OK, at least all I've seen do. Yuo need SRAM so save programs or instrument set ups.
The progam cards from HP were mostly OTP ROM.
Robert.

From: Ralph Mowery
Topic: 2124  Message: 2141

I am sure you have found the answer by now.  If not.
You generate the signal and counter by using the duplex button.  Set the input to the antenna port and output to either the RF or Duplex port.  You read the counter off the screen and adjust the frequency generator from the screen.  If you have any of the manuals , just treat it as a repeater setup.
You do not need a dummy load after the atteunator.  The RF in is terminated by the internal 3 watt atteunator.

Subject: [hp8924] Frequency counter and signal generator at the same time, and attenuator question

Hello,

I need to calibrate a receiver and the service manual specifies a procedure that involves connecting a signal generator to a test point and a frequency counter to another, checking the reading at the freq. counter while adjusting a variable capacitor and generating a signal at the same time. I would like to know if I can use my 8924c for this purpose and what procedure I should follow.

The other issue is: I have a 3W input attenuator inside the 8924c, and an external 100w 40db attenuator. I would like to know what's the recommended setup to test devices that output up to 100w with these components. Should I connect the rig output the attenuator, and the attenuator directly to RF In of my 8924c, or I should rather use a dummy load in parallel?

Last but not least, I have to replace the volume control pot and the RF In N-female to SMA female connector in the front panel. The former was broken during delivery and the latter has one of the inside pins missing. I have high quality replacements (new Bourns equivalent part and a quality RF connector). Should I attempt to recalibrate or do anything special before and after reassembling the 8924c? Replacing the pot should not require any recalibration AFAIK, but the RF In connector might be an issue, even if negligible, I guess.

Thank you!
Lorenzo

# 2143. Mesh-covered rubber or foam gasket (like a foam core grounding or shielding strap) from front assembly?

Yahoo group: hp8924
Date: 2015-05-16 18:57:07 UTC
From: EA5125URE
Topic: 2143  Message: 2143

Hello,

I have finished fixing the problems my 8924c had with the volume pot and the RF In coax connector (I will send photos and an update later but good news is, the bulkheads I found fit perfectly, although I used an original part from the spare front assembly I have received).

However, I found a mesh covered/shielded piece of rubber or foam gasket, very short, which might have fallen off one of the front assemblies. I cannot find a reference in the assembly repair manual to it. It is just a gasket, a rubber cored metal strap. I suppose it is used for improved grounding or EMI shielding somewhere, so it bothers me I did not notice it before. Needless to say, my "good" front assembly was not pulled apart, I only removed the nuts and bolts for the front BNC ports, and the four screws for the monitor assembly, after carefully unscrewing the RF In bus jumper that goes to the attenuator unit.

If someone could chime in and solve the uncomfortable mystery it will be greatly appreciated!

Thanks!
Lorenzo

Hey Yuri,

Where do you mean exactly? This seems to be MP57 definitely. Not shown in any drawings... it is a RFI shielding gasket, so wherever they decided to put it, it was meant to prevent stray RF from interferring. That's why I am worried. I did not pull it out myself, it fell, either when I was disassembling the replacement front assembly to pick my parts, or when I took the full CRT assembly from my working unit so I could change the RF In N-female connector. But then I don't know how it was "fit" there. There is no groove around the CRT cage. or between the cage and the front panel.

I really hope someone chimes in with more details, since I need to assemble this thing tonight.

I seen similar thing in my 8920 in a groove that is around the back side of front panel frame, where the front end of outer case mate with front panel. Also, something similar (but thinner and shorter) was in grooves under the covers of RF-tight boxes that housed RF portion of TDMA adapter that I used for parts in the past. Maybe input assembly may have such thing under the cover, cannot remember right now.

Hm.

Yuri, mine has a "finger" strap, one of those with series of triangle-shaped spring tabs, on one side. The other is bare. The front assembly I got for parts has none of that. It could come from there. I did not disassemble the RF In block in my good unit, I just pulled out the whole CRT + RF block together. You only need to remove the two BNC nuts and the front torx screws (4 of them under display bezel), plus RF In solid wire/bus jumper from RF In N-SMA Female connector to the attenuator input.

This one is round, fairly thin and 43-44cm long. Rubber core, metal shielding. Just a normal EMI gasket.

I will mail Rick, but in my personal experience repair shops dont offer advice for free. They would rather have people send their equipment in for repairs. Ditto for everything else. When I asked him last time about the actual location and replacement parts for the volume and squelch potentiometers, he did not reply. I'm not saying this negatively, he is not obligated in any way to help. But help is what I'm looking for, not a commercial service (mostly because I already have the parts). If we forget that, at some point support will die for these units.

I will try reaching out to him, though.

My 8921A has the accessories compartment on the front cover.

It looks like the one shown in this picture

https://www.google.com.au/search?q=hp8921&espv=2&biw=1745&bih=855&source=lnms&tbm=isch&sa=X&ei=fMRXVbu5O-XvmAXBnYGQAg&ved=0CAcQ_AUoAg#imgrc=_jPtE-9QV-aqlM%253A%3BbZmRx7VaUpwamM%3Bhttp%253A%252F%252Fmlb-s1-p.mlstatic.com%252Fmonitor-service-hp8921a-analisador-de-espectro-250khz-a-1ghz-583001-MLB20262048271_032015-F.jpg%3Bhttp%253A%252F%252Fproduto.mercadolivre.com.br%252FMLB-637345502-monitor-service-hp8921a-analisador-de-espectro-250khz-a-1ghz-_JM%3B1200%3B900

# 2158. Some good news: Melcard EEPROM cards support (and virtually any other card) and dirt-cheap RF In bulkhead replacements

Yahoo group: hp8924

Hi,

I have some good news:

1) Cheap MELCARD EEPROM cards are fully supported by HP 8924c and possibly others. If you refer to the reference guide, you will see it mentions MSDOS (FAT12) formatting.
These cards are *WRITABLE* and readable just fine, and while Windows support might be clunky, you can use a Linux system (with a kernel of the 4.x series) to flash and format them/ I have had success formatting a 2MB MELCARD data I bought for 20 USD using the Linux-MTD tools, as FAT12, with the mtdblock module. All I needed to do is use flash_erase to remove write-protect (if enabled), clear the EEPROM sectors and leave them ready for flashing. Afterwards I used flashcp to directly write the .bin file available in the Files section to the MTD device created via the pcmciamtd module. It is imperative that a kernel of the 4.x series is used, since they contain the new patches that enable support for PCMCIA cards that have no CIS/attribute memory. These are not supported by Windows unless you invest on expensive software. You DONT need a special reader. You DONT need special software. Linux kernels of the 4.x series will initialize the cards as anonymous memory cards, using a fake CIS, which lets the pcmciamtd driver handle them. Note that EEPROM writing is very slow, compared to SRAM. But the bottom line is: you don't need to spend much to get RF Tools and a working external card for your test equipment.

If I have time I will prepare a TinyCore based Linux system you can boot directly off a USB disk that will flash RF Tools to a card of a minimum size, provided that your computer has a working PCMCIA slot.

2) You don't need special or original parts for the RF In bulkhead Type-N Female to SMA Female adapter. These worked for me, although I ended up using an original part since I had a spare front assembly:
http://www.ebay.com/itm/1pce-N-female-jack-SMA-female-jack-nut-bulkhead-RF-adapter-connector-/320847613586?pt=LH_DefaultDomain_0&hash=item4ab4020e92

The original is exactly the same size, the only thing that changes is that it is locked in place with four screws unto the front assembly panel metal frame. The adapters above (and any like them) will fit perfectly. The nut can be tightened properly and the adapter won't move or disturb anything else. The depth inside the frame is the same. Therefore, for those who don't want to spend money on original parts, you have a working replacement for 3 bucks, or less, depending on the seller. I've used that shop and their connectors are gold plated. But

other sellers probably have the same items, just double check.

I have attached pictures and will upload them to the files section. To sum it all up: any PCMCIA slot in a laptop will work, it's a software issue. F-EEPROM cards work. There is no magic involved. F-EEPROM is slow, SRAM is faster. F-EEPROM doesn't need a battery. You can flash RF Tools easily with very little effort. All you need to know is the VPP of the card (3.3v or 5.v usually, NOT 12v for EEPROM/SRAM cards) and have a Linux system at hand. You can boot one with a USB stick or a Live CD. You need the 4.x kernel versions for proper support of the older cards.

Hopefully this alleviates the problem for some people who erroneously came to think they need to pay a ridiculous amount of money for enjoying RF Tools in their rigs. Also, the readily available bulkhead adapters might be a good thing when original parts dry up, or become ridiculously expensive. If it affects calibration so strongly, I would like to see actual technical data to back up such claims. I doubt so very much.

Same goes for the PCMCIA memory card vendors, and the ones who cater to Windows users. Paying several hundred for a glorified DMA interface is not OK. Myself, I'm quite happy I could sort out all these issues spending a negligible amount of my money. I hope this helps!

Cheers!
Lo

"I am sure you know the 859X covers will work"
Not quite, due to connector location differences the analyser covers don't fit an 8920/21 unless you cut holes in the storage cover.

Hi,

I did not mention using writing from the 8924c, since my point was that for 20 bucks, or even less, you can have RF Tools and other stuff at your disposal, up and running, which is what most people are interested on. You have plenty of space to store presets in the internal memory.

However, to answer the question: yes, you can write the cards. But the procedure isn't for novices. You need to know your way around the Linux MTD tools. Basically the card memory may require a specific VPP set and a 'write protect disable' operation that must be done at low level, with software communicating with the Flash/ROM/memory device directly. The 8924c on its own will not be able to unlock that on its own. You need to reset it on the PC.

I also dont talk unspecifics, so I wasn't going to promise writable cards with F-EEPROM based storage. For really easy in-device writing, you can have cheap SRAM cards from MELCARD too. There's a pretty big chance that soem other EEPROM card could be written by the 8924c, if its driver supports the flash/memory chip properly to issue the erase/unlock commands.

I will investigate though. This is really a software issue. Do you know if there is any hidden menu to access card diagnostics?

As for part numbers, I passed the link earlier in the long SRAM card thread. I can dig it again sometime later but it's easy to find. Also you can see it in the photos....

Oh, and keep in mind ALL of the cards out there are most likely second hand. Caveat emptor, these cards eventually become unusable due to non existent wear-leveling. Pretec and friends too. It's a necessary evil of the tech. Mine seem fine, but they have no bad sector or cycle reporting facilities.

BTW if you send me some preset files (or a bin dump, as in a raw dump, bit to bit identical) of a card containing presets, I might be able to write a tool that lets you configure presets ready to be written to the F-EEPROM.
I frankly prefer to write protect my cards, but being able to flash presets from the computer would be nice.

Cheers

# 2163. RF Tools on Linear Flash Card - ready to go $50

Yahoo group: hp8924
Date: 2015-05-18 13:59:21 UTC
From: robert8rpi@...
Topic: 2163  Message: 2163

Firstly, well done to Teslascope for finding the MELCARD F-EPROM cards and a LINUX solution for programming them. However, for those who don't want to delve into LINUX, don't have a laptop with a PCMCIA slot or simmply not hunt doewn a card with a chance of it being faulty(I have a small box full of ones that don't work if anyone wants one :-), I can still offer RF TOOLS (and the NA FM tests, but they mostly don't work on the 8924C without modification) on a professional quality Linear Flash PCMCIA card for $50 US including shipping to list members. I also include a CD-ROM with manuals and other useful stuff.
I know it's a sales plug, but $50 barely covers the cost of the card and shipping.
If interested, contact me directly at robert8rpi AT yahaoo DOT co DOT uk

Regards,
Robert G8RPI.

The connectors are not in the same spots as the 8920 but they use the same type on the 8590 spectrum analyzer do the covers clear just fine on the ones I used.

And yes those covers do have an accessory compartment.

I have used an 8590 cover numerous times on 8920's ...just say spectrum analyzer instead of the typical 8920 label in the middle of the front.

It may have a different internal layout for the accessory compartment and these were the older 8590 front covers .

Hi Ralph,I can only find the non-compartment covers. When I tried a analyser cover, I can't remember the exact model, on my 8920A it would not fit. The BNCs at the right hand side foulded the cover. It may be that later covers are more universal. I know the part numbers have changed over the years. I've always found the analyser covers to be harder to find than the test set types.Does your test set have the mounting hooks already fitted? Robert G8RPI.

From: richnaomi@...
Topic: 2168  Message: 2169

Be fantastic if there were.

Imagine the power and weight savings for field work (for the 8920 & 21 anyway).

Also, being able to increase the display size to the full extent of the frame/bezel would be awsome.

Alas, the only LCD mod I know about is the Video converter that allows you to run the rear video output signal into a computer monitor. I have this setup on the bench, but I still find myself looking at the tiny green CRT because it is close to the controls.

With the number of these things still in daily service, maybe someone will come up with a practical LCD mod for the internal CRT.

Hi,There are kits available for the vector scan instruments like the 8566 spectrum analyser but these are expensive. At least one kit includes a modified bezel. I don't know of a "plug and play" kit for the 892x range. You could just fir athe Gonbes converter and a small VGA panel. These panels are sold quite cheaply for use in cars, they often have composite vidieo inputs too. you would have to do your own mounting hardware though. I could do it but have no need to for myself. Robert G8RPI.

LCD's for popular HP kit are made by Simmconn Labs.

Find them here...

http://www.simmconnlabs.com/

and here...

http://stores.ebay.com.au/simmconnlabs?

I'm considering getting a unit for my 8566 since its CRT beginning to dim.

regards

Tim

The 892X wouldn't be that bad to convert to LCD since there is in inexpensive VGA converter and lots of cost effective LCD based VGA screens that could potentially fit.

The CRT assembly and new tubes still seem to be plentiful so at this point I would just stick with fixing vs. upgrading.

It may save a few pounds of weight but you may have issues on the 8920 with screen brightness in direct sunlight fro field work

I would second the comment about screen brightness. In my past life I had a handful of special purpose terminals with lcd screens that looked great indoors but were essentially blank in sunlight or even bright shade. Night time no problem.
If memory serves correctly the screen brightness was measured in nits, not the ones that itch, and for outdoors the screens had to be at least three time$ brighter.

It can work both ways.

Personally, I find it almost impossible to see the green screen crt on my 8920 when the sun is shining on it.

I also have a General Dynamics R2950 service monitor that allows you to set the LCD display to traditional black on white monochrome LCD. In that mode, the display is fantastic in the sunlight.

Almost all service monitors suffer from the sunlight problem and usually require you to relocate to the shade somewhere.

Ebay item 371075775010 does look promising but as a previous poster pointed out, is it really worth going to the trouble to re-engineer the display when brand new CRT's are still available for a few hundred $'s?

# 2178. Re: LCD Conversion

Yahoo group: hp8924

"...is it really worth going to the trouble to re-engineer the display when brand new CRT's are still available for a few hundred $'s?"

I have never been a big fan of CRTs, even when it was the only choice available. I always believed that there's got to be a better way. My main gripes are reliability, heat, power consumption, size and weight.
So...yes, I would be very interested in an LCD conversion for my 8924 IF I could afford it. I set a very limited budget for my hobbies these days and I haven't seen any prices (I NEVER go to ebay) so I don't have much perspective on that part of the solution but I will watch the topic carefully.

A search brought up the following info from the Agilent Technologies E8285A CDMA Mobile Station Test Set Product Note http://cp.literature.agilent.com/litweb/pdf/5968-8837E.pdf http://cp.literature.agilent.com/litweb/pdf/5968-8837E.pdf
"
Automated Software
E8290A PoST PC-Based Software
The 8924C and the E8285A can both be utilized in conjunction with the new E8290A Point of Service Test (PoST) PC-based software to automate dual-mode mobile phone testing. The easy-to-use, mouse-driven, on-screen graphics allow operators to make fast, accurate, and repeatable measurements with minimal training, virtually eliminating the need for manual interaction with the 8924C or the E8285A. This allows sales clerks and other non-technical personnel to perform testing at the point of sale, and thereby respond more quickly to customer problems.
A built-in database allows the operator to view results for further analysis. Reports can be generated and data can be combined into customer-care databases so trends in phone performance can be characterized. The 8924C or the E8285A and E8290A solution saves cost by reducing the number of No Trouble Found (NTF) phones sent back to manufacturers and by reducing the number of phones handed out as exchange replacements.
The combination of the E8290A CDMA PoST software and the 8924C or the E8285A provides a practical test solution to meet your R&D needs as well. The E8290A features two modes of operation: one that ensures ease-of-use for non-technical users, and another that provides access to a rich development environment.
In the software's password-protected development mode, technical operators can access the software's full set of capabilities. Test configurations, tests plans, test specifications and measurement parameters can all be set up and customized with ease"

So not of use to us

Nah it's too small for most cups of coffee. I was hoping it was for Power On Self Test, but it's not oh well live & learn.

# 2186. AGILENT E8285A firmware downgrade possible?

Yahoo group: hp8924
Date: 2015-08-14 23:18:38 UTC
From: Frank Hughes
Topic: 2186  Message: 2186

Hi,I have had an E8285A for a few years(bought from AMTRONIX) for amateur radio use, works great, and addingthe "RF tools" made it even more useful. A0204 firmware.
This week, an excellent conditionE8285A came up for sale locally too cheap to pass up.
The only issue is that it is runningA0509 firmware, and thus won't operate at HF frequencies.
Is downgrading the firmware evenpossible?
If the firmware could be downgraded,how would I get it calibrated for the lower frequencies, is this afactory only cal?
AMTRONIX says: "Some newer E8285A units operateonly from 800 MHz and above because they have newer firmware andtheir input module was not factory calibrated the full range.
Most E8285A units with newer firmwarecan not be converted to 0.4 to 1000 MHz use because the factory didnot calibrate the input module for use below 800 MHz."

If the new E8285A is just going to be aparts donor for the older one, OK, but I just want to be sure thatthe newer unit is impossible to make operate at HF frequencies.

Hi,I don't know the E8285 as well as the 8924, but as far as I know they use a solid state input module. The solid state input modules won't go down to 400kHz due to the PIN diode switches and blocking capacitors, so the erfonce is in theory limited to 30MHz. Check the 8924C and E8285A Assembly Level Repair Guides to see if the input module is the same part number.  If they are, ask Keysight if they can calibrate a "8924" input module down to 30MHz. They have been making  lot of noise about supporting older instruments of late.
HTH,Robert.

Hi Frank. I have the older firmware and have applied it to one of my two E8285A's. The firmware updates flash data stored on Main Processor, DSP Processor, Cell Site 1 Processor, Cell Site 2 Processor & Protocol Processor cards. Once this is done, those cards are now no-longer interchangeable with units running a different firmware version - they all talk via a serial BUS upon boot to confirm status, firmware version, etc. Your correct that the calibration will be out once upgraded. The Calibration data for the downconverter is stored in U304 (Xicor X25128 128K serial E2PROM) - it stores DAC filter values (see page 257 of service manual) for TUNE 1, TUNE 2 & TUNE 3 at various frequencies - I believe these are burnt at factory. I have read the E2PROM to see if I could make sense and hack it but its gibberish to me - I need an Intel HEX file of a factory calibrated E8285A so I can compare bits. Now, I did find that through a service menu I could manually adjust the hex values for each filter to vastly improve response at HF. Problem is, you can't store those values and I couldn't see where in the E2PROM they were to change. So I'm sort of stuck until some kind soul can provide me with a U304 HEX of a calibrated HF capable E8285A. Also of note, when I downgraded mine, I plotted the sensitivity so you can see what sensitivity ends up being - I'll upload it to the photos folder under ZL1CVD album. 73s om de chris zl1cvd

Hi Chris,As I understand it, if you buy a replacement input (or some other modules) from HP/A/K it comes with a PCMCIA card with calibration factors on it. Presumably these are written to the EEPROM, so it must be possible to change the data without removing the EEPROM.

Robert G8RPI.

Totally different modules - E8285A goes to 2GHz and uses up/down-converters. But yes, they are PIN diode filter tuned and HP recommended them 'accurate' for 30/40MHz or above. They do however work down much lower with reduced and non-linear sensitivity. They are certainly not flat response like the relay switched 8924C & 892x analogue modules...

Yes, that's correct for options like attenuator, spec analyzer, etc. But I cannot see how the circuit can support writing serial data to the IC in question. Could be wrong but when I asked Rick, he indicated it was a factory job - having desoldered it, read it, studied the surrounding circuit, I think this is the case..

Frank, I recently did exactly what you describe. Amtronix sent me the PC card with the lower rev firmware, for a slight fee. There is also a New Zealand ham on eBay selling the same thing for maybe about $100, don't remember the exact amount but search on 8285a. The procedure takes maybe ten minutes. The good news is that comparing it to my 6380's it is obviously accurate on frequency but also real, real close on levels. Not close enough to swear to in commercial service but if you are troubleshooting something it is fine. I found the NZ guy too late and had already paid Amtronix, where I could have bought and kept the cards from the NZ guy. I got my 8285a from a government auction, and while the shipping company dropped it and mangled three never used BNC's on the front right lower corner the unit is fine and I want to find more, convert and sell. I paid $120 for the one I have plus $60 to Amtronix.

From: george@...
Topic: 2194  Message: 2194

Chris was asking for schematics, etc, made me look. just realized that my definition of assembly level service and HP's is very different. I was almost certain I had schematics and it turned out to be only block diagrams and where the happy lights are...

But thanks for the calibration procedure. Wouldn't saving as "POWERON" retain this? I'd try but mine is buried in the 100º garage

# 2200. E8285A batteries question

Yahoo group: hp8924
Date: 2015-09-08 11:40:12 UTC
From: hp_ciscovss@...
Topic: 2200  Message: 2200

Hi,
I want to replace the batteries in mine, don't have any manual for the E8285A (yet - on order from ZL1CVD)

I know which p/n to order (658-BR2-3AE2SP) from Mouser for the 3V Lithium.
I even found this battery during the recent dis-assembly.

No idea where or what kind of battery for the "Coin Cell": is it solder tabs or snap in?
Mouser:
658-CR2477 - snap-in

658-BR2-3AE2SP - solder pins

The button cell is located on the memory unit (E6380-60151) and is soldered in. The other is located on the regulator unit (E8285-60102) and is also soldered in. 73s om de chris zl1cvd

# 2202. OPT 005 - Memory Upgrade for 8920A

Yahoo group: hp8924
Date: 2015-09-11 05:55:55 UTC
From: jheine3@...
Topic: 2202  Message: 2202

Does anyone know how the option 005 (Memory upgrade) works on the 8920A Models?

I have a 8920A that has memory board (P/N 08920-60166) with only 4 of the 6 extra memory chips installed. Total memory installed is 640.0 kBytes according to RAM_USAGE in the tests menu. I installed 2 additional SRAM chips of the same type and was expecting the memory amount to increase.

Checking out the CLIP (08920-90107) Page 86 there a note at the top [04/15/91] which shows the RAM addressing and mentions OPT3 for U29 & U30, these are the newly installed ones. There's also a note "Optional Memory * see 02/05/91 note" that may have more info but I haven't had any luck locating that one.

Have any of you guys ran across this? I'm thinking the extra ram may have to be turned on somewhere in the firmware...

I trying to figure if there's a correlation to options installed and the value that is located in
the CONFIG > LATCH > "INSTRUMENT_OPTIONS" Value.

If anyone could take some time to check a few things on your unit for me, I would be grateful.

- List the firmware version
- Options installed (lowest to highest)
- Memory amount (TESTS > RAM_USAGE)
- Instrument Option hex value (CONFIG menu, LATCH name = Instrument_options)

For instance mine would be:
Version: A.14.14
Options: 001, 002, 003, 004, 005
Memory: 640 kbyte
Instrument_Options = 2F

Thanks

Jay

# 2203. 8924c not powering up, where to start

Yahoo group: hp8924
Date: 2015-09-16 06:40:50 UTC
From: Ross Johnson
Topic: 2203  Message: 2203

Hello group,

This could not have happened at a worse time. A repeater moved causing my coordination to change and now my saving grace wont turn on. It was working fine a couple months ago. When I first checked it the green LED was on, on the back of the unit (even with the button off) but would still not power, and now it's no longer on after being unplugged and moved. Made no sounds or smells just dead.

I really regret leaving it plugged into a energized outlet all these years. Guessing power button off was really just stand-by.

Just looking where to start and if these symptoms are known. Looking over the posts I see 1000's related to power supply but not a failure like this.

Thanks for reading,

I'd be checking for physical damage - remove covers, remove front & check the switch with a meter. Pull out the supply, remove covers, check AC socket - especially solder joints. R23 gets hot so its joints dry out. Look closely with a glass before re-soldering - if it was dry, chances are problem fixed - throw it all together and give it a wurl. While your in the supply you should do all the caps but you asked for a quick fix... 73s om de chris zl1cvd

I think you can find some info in the files section of then ews group about replacing capacitors in the power supply.
I had one that the green light was on.  Sometimes it would power up and if left plugged in, it would come on every time.  If left unplugged, it might take it half an hour to decide to come up.
Amtronix  supplied me a new supply  (rebuilt I am sure) for about $ 200,but I got $ 50 back when I sent them my old one.The first one I got from them the green led would not come on.  A phone call or email (don't recall which) to them and another one was sent out right away.  It has been working fine for over a year now.

Update: the green led on the power supply is back no matter the state of the power button again.
Case in point, i need a quick fix, should I just throw a new PS at it and cross my fingers??? It's just not good I like to fix things...
Thanks again,RossKc7rjk

Hello group,
This could not have happened at a worse time. A repeater moved causing my coordination to change and now my saving grace wont turn on. It was working fine a couple months ago. When I first checked it the green LED was on, on the back of the unit (even with the button off) but would still not power, and now it's no longer on after being unplugged and moved. Made no sounds or smells just dead.
I really regret leaving it plugged into a energized outlet all these years. Guessing power button off was really just stand-by.
Just looking where to start and if these symptoms are known. Looking over the posts I see 1000's related to power supply but not a failure like this.
Thanks for reading,
Ross kc7rjkkc7rjk@...

# 2208. Question regarding 8285 RF diagnostics failures.

Yahoo group: hp8924
Date: 2015-09-16 22:05:31 UTC
From: blaze_1024@...
Topic: 2208  Message: 2208

Good Afternoon,
New to this group an the 8285.
I need some advice regarding some error messages I'm seeing on a newly acquired 8285a

While evaluating this unit I ran the the built in RF Diagnostics program and get 42 failures, As best I can tell they all seem to revolve around the DAC such as the filter tune DAC gain. Also when pressing the messages button I see a message
"New module Cal detected uploading Cal file OUT_DIAG_LIM"
The next line reads
"Cal checksum error in file OUT_DIAG_LIM"

Upon quick review of the Assembly Level Repair manual As best I can tell this might be something that can be resolved by running the "Periodic IQ, or IQ Demod Path Calibration Programs.

I don't know this piece of equipment that well and am looking for advice, Are the "Periodic IQ, or IQ Demod Path Calibration Programs" something that should be left for a service center to perform or is it something that is safe for me to run without risking making problems worse

For reference I'm experienced using older Motorola and IFR equipment, this is my first HP Test set.
Best Regards
Dan

ps: I will attempt to upload screen shots of the error screens..

the best option is to list this on Ebay and factor in the packing cost from the UPS store.

You will get more bidders if you can ship it

These units are heavy but can still be sent by the usual carriers.

Good luck

I HIGHLY recommend a foam-in-place pack for the -8924. Anything else and Brown will do it to you.

Mike

Guess that I was lucky.  Bought one a few years ago and it had about 6 inches of bubble wrap around it.  Nice units,but very heavy. Just glad the repeater I work on is in a building at ground level and I can drive very close to it.

I am looking at a HP 8922S with the option 1 (high stability osc) in it. It seems to be about the same size as the 8924. It seems that it may be able to be used as a service monitor for other than the cellphones to a limited extent.

It is rated form 10 MHz up to 1 GHz. Can frequencies be put in lower than 10 MHz and just not be calibrated as to power like the 8924 ?

Can it be set to generate FM on one port and receive on another for setting up a repeater ?

Does the unit use the same video assembly as the 8924 so that if the video went out in my 8924 I could swap out the assembly ?

The price is inexpensive enough , but I don't need another piece of gear around that weighs 70 pounds if it is not any good at all.

I did download the manual for it and looked through it.

See below.
I have a 8922 and sometimes use it.
There is no component level repair manual.
The best that I have seen is the assembly level repair manual.

You want one with option 006, this is the tracking generator
>

10 MHz is the lower limit

I do not think so, but am not 100% sure

Not sure, but, the 8922 was probably used on a production line and left
on 48 hours a day.
All that I have seen have burned displays and are usually dim.

Hi.The 8922S is NOT the same as the 8924C. It was designed as a GSM telephone test set, not developed from the 8920 analog test set as the 8924 was. It has no analog modulation or demodulation. The base model is  (apart from GSM testing) just a 10MHz to 1GHz CW generator, 25kHz audio generator, 50kHz 'scope, !Ghz counter and apower meter (to 41dBm). A big box for that lot. Option 006 adds a 10MHz to 1GHz spectrum analyser, but even that is limited, e.g. the maximum span is 10MHz (spec says 4MHz).The monitor is the same as the 8924, so is the rotary encoder. Some modules are common but not all. The power supply is completly different. The ones I've seen with the high stability option had a 10811 series OCXO. Other than that they really are a bit of a boat anchor.

Robert G8RPI.

Thanks Robert, also to Glenn for the info.
The unit I am looking at does not have the SA option, just the 001 which is the frequency option.
I though it might be designed from the start as a cell phone test set and not the cell test added on like the 8924c was to the 8920.  I may make a low ball offer for it and see what happens.  Too bad this one does not have a SA and the thing weighs more than the 8924c.

The weight is because they have a linear PSU with a big iron core transformer. Without the SA they are hardly worth the shipping cost. I recently sold an 8922M with SA but not the precision reference for about $250.

Robert G8RPI.

# 2222. Re: [hp8924] HP 8922S

Yahoo group: hp8924

From: Ralph Mowery
Topic: 2216  Message: 2222

Because the one I am looking at does not have SA I am thinking about offering about $ 100 for it including shipping to me.  That is about $ 40 less than what he wants.
My thinking is that if the 8924c I have craps out there may be some parts (modules) in it that will go in the 8924c, especially the CRT module.  Was hoping the power supply would also work,but as you say it will not work, that really makes me think it is not even worth the $ 100 I was going to offer.

From: willard561@...
Topic: 2216  Message: 2223

Part of the difference between the *922 & 8924 was the IS-95 phones the 8924 was designed to test were a dual mode phone, they had both IS-95 CDMA & the older AMPS functionality in them. AMPS was a FM based analog system so it made sense to base the 8924 on the older 8920's. Where as the GSM phones for the most part never had the analog capability built in.

If you still can't find the video, go to /amtronix.com/ as they have
excellent writeups about some of the features of the 8924.

I have been searching and am unable to find it anywhere.

If someone has it I could send a TransferBigFiles.com link to transfer it easily to me.

Thanks,

Tom,

That’s true (and I didn’t mean to come off as such a hard-ass), but you do (I suspect) have a choice in your ISP.

To the group owner, it costs nothing to host a group on Yahoo. They rely on embedded ads, etc. to keep the lights on and the bits flowing – the group itself costs nothing to the user. (In other words, you’d get the exact same service if you had Brand X Internet in your home.)

My point, is that it amazes me that we – as Americans – would bitch if we were hung with a new rope (to borrow a phrase from my dear, departed dad).

‘Nuff said; let’s go tune some duplexers or something!

Mike

# 2246. 8924C FM Measurement

Yahoo group: hp8924
Date: 2015-10-17 18:19:48 UTC
From: wb4yjt@...
Topic: 2246  Message: 2246

I was doing calibration tests on some of my test gear today,
using Bessel null techniques to obtain accurate deviation measurements.

My HP 8901 tested fine, as did my Motorola 2001d.

But, the 8924C read almost 20% higher than it should have.

I took a look at the various filter settings, and they seemed OK, -
HP at 50, LP at 15, and IF at 15.

But I decided to try a different setting for the IF filter.

It was set to 15 KHz, and I switched it to 230 KHz.

Imagine my surprise when the deviation then read correctly!

Anybody have any comments on this?

# 2250. hp 8922s again

Yahoo group: hp8924
Date: 2015-10-20 16:22:58 UTC
From: ku4pt@...
Topic: 2250  Message: 2250

I bought a 8922 partly because I understand the crt unit is the same as my 8924c just in case it ever went out.
Also to check it against both units to see how close they are to each other. Only about 30 hz off at 900 MHz between the two units. Not bad as it is hard to tell how long it has been from the last calibration.

One thing that I ran across it the deviation readout on the 8922s seems to be stuck in the RMS mode. The manual says it should have all the functions of the 8924c such as sqrt plus, minus, peak and so on. I have looked all over the thing and can not fine out where to change it on the 8922s.

Also it is suppose to have several filters such as low pass like the 8924, but I don't seem to be able to find where to set them either.

Can someone point out where to get to them ?

This unit only has the high accuracy for frequency option installed in it.

If the instrument has a spectrum analyser option, one can also use the Bessel null method. When the modulating frequency fM = 1 kHz, the carrier will null out when the peak deviation is 2.4 kHz.

On the 8935, 8921A, 8920A/B Opt. 102 etc., set SPAN = 5 or 10 kHz to select 300 Hz RBW (the minimum RBW value).

I watched it and it had very good content. Thanks for those that made it possible.

Not wanting to seem ungrateful, but might it be possible to contemplate, with bigger and bigger files becoming more common, and PC technology advancing so fast, for a higher quality digitization of the video to be produced? As an option alongside the 1 Gig

file that we have?

Maybe even a distribution of a highest grade DVD clone of the original VHS source?

I realize the VHS available as the "master" may not be the greatest to begin with.

Hank

What version of widows are you using ?
I was using Windows XP.  I bought a used computer with Win 7 Pro on in about 2 months ago and did not run it but a day or two to see if the computer was ok, then loaded Win 10 on it.  Many of the older XP programs don't seem to work .  Some have to be loaded in their own directory instead of the program directory.  One of the dongles that plugs in the usb port and  allows the computer to be a TV set will show the video, but no sound.
 From what little I have  researched Win 10, there seems to be a lot of sound issues with it and older programs.
I seem to be getting a stack of computers just to keep things going.  Almost have to decide which computer to run a program on.  Needed some old laptops to use the PCMCIA card of the 8924c I have.  Also needed them to program some old Midland  and GE transceivers.  I did skip Win 7 and 8, but thought  while I could upgrade a Win 7 computer for free, I would go for Win 10.  Got caught one year when the tax program would not run under under win 98 and had to go to XP.
I think I have  computers on Dos 6 and WFWG, Win 98, XP and now Win 10 just to run all the different programs and interfaces.  Just hope I don't need the Win 7 or 8 versions , or will be looking at another computer.  Then there is the Android system on the tablet and smart phone. I did get rid of my TRS 80 years ago.  Sure hope I don't have to go back and need that one.
Buying a Dell with 3.3 gb speed and 8 meg of memory and large hard drive for $ 140 off ebay and the Win 7 pro disc and updating to Win 10 for free seemed like a good deal to stay up to date..  I am not into gaming or anything that I need all that much  power for.

I have one of the boxes shown below. It's abt 4 years old and works daily without a hitch. It was well over $200 when I bought it. It's puts out a nice green screen on a VGA monitor.

http://www.ebay.com/sch/i.html?_from=R40&_trksid=p2055845.m570.l1313.TR10.TRC0.A0.H0.Xxvga+box.TRS0&_nkw=xvga+box&_sacat=0

Has anyone used one of the converters available on e bay to use a modern LCD monitor with HP equipment that produces a 19.2kHz video output?

The converters on e bay are really meant for the old video games, I think. 15kHz

Any suggestions?

Hi Wally,
If you don't mind a bit of construction, the Gonbes converters on ebay work well for less money. The GBS-8200 is about $25
(the nearly identical 8220 will drive two mointiors) and works well. You need to add a sync separator (LM1881 or a comparator), a couple of resistors , case and powersupply.
I've done a couple and they work well. You can get a picture without the exra components, but it's not stable.

Robert G8RPI.

I saw all the cheapo game adapters and did some searching on what it would take to make it work. At the time there were several people adapting them but each had a different approach and I couldn't get a definitive answer on what to do. I use it in my business and don't have time to tinker around to save a little money so I bought the one made to work with the 8920A. I was a little nervous about it but it all worked out.

Hi Wally,I'm not sure exacly what box Clif has used, but the ones that come up on the link seem to be just a boxed version of the GBS8200 board. From the published specification they need separate sync so not sure how you would connect them to a 892x. I found with the GBS-8200 that you could just connect the C-sync input  in parallel with the green video input (with a blocking capacitor) this gave a picure but was not stable.The choice is how much work you want to do. A "plug and play" solution will cost more. I'd be happy to sell you a converter and  leads for $150 including shipping. This would be a boxed up GBS8900 with LM1881 and all you need to connect to a 892x and VGA monitor.

I don't know where the confusion is? I use the EXACT box shown in the Ebay listing I posted. On the 8920 there is a BNC "T" hooked to the CRT output. The 2 BNC cables go to H/CS and G/Y inputs on the Xvga Box. The monitor plugs into the VGA output. A wall wart supplies power. That's it. It should come with instructions on the setup if not e-mail me and I can give them to you.

Hi Clif,

The 982x Video is 19.2 kHz composite video and sync Neither the GBS-8200 bare board or cased 8219 are documented as supporting composite sync and video. Your connection of the 892x output to the converter video and combined sync inputs in parallel, while unconventional obviously works better with the 8219 than the 8200 I tried.

Hi Clif,Well most of the units on ebay are not being sold for 892x displays :-)
I wonder if the seller modified it by adding a sync separator to the combined sync input? I would have my doubts about a  unit bought on ebay working on a 892x unless the seller specifically says it will. That leaves the expensive "industrial" converters of DIY mods.

Hi Wally,
OK, Thet seller had a link to the manual which helps. The GBS8219 (XVGA Box) supports SoG (sync on Green input, which the 8200 does not. This explains it working without an external sync separator. If Clif had to connect the Green and CSync input in parallel, it suggests it only picked up one of the sync pulses on the green. But it also sounds like any of the xvga (GBS8219) boxes should work. You will ave to select the correct configuration through the menu system.
Just connecting the video to an LCD TV is highly unlikely to work. The only type of monitor that will work is a true wide range multistandard one like the original NEC Multisync CRT monitors. Unfortunatly NEC played on the reputation of the original Multisync and used it as a brand name on later monitors that were not multistandard, so most later "Multisync" monitors won't work/

Hi Clif,
I think Wally was asking if you could connect the 892x directly to a TV type LCD monitor. Any standard VGA monitor like your vs17will work on the output of a GBS82xx converter.

I did a little research and thre is more information about the GBS-82xx boards available now.
They all use a TV7525 upscaler chip what is capable of handling the 892x video directly (it needs one additional 1nF capacitor for sync on green), but needs to be set-up correctly. The boards use a microprocessor to set-up the 7525. Depending on the firmware in this micro, the unit may or may not support the 892x video without a sync separator. It looks like the XVGB (GBS-8219) boxed units are better in this respect. At least one gaming enthusiast has posted code for the RaspberryPi that allows you to set the 7525 registers directly which allows additional modes and tweaks. Having used that to optimise settings for for the 892x you could use a PIC as a fixed "loader". I don't think it's worth spending the time though. The data for the 7525 runs to 3 documents and hundreds of pages.I might open up my 8200 and see if it has the SOG capacitor fitted though. More recent version of the 8200 may have better firmware for use with the 892x, but you would have to buy one and try it.

Robert G8RPI.

Do you have  a return loss bridge and a good (very low swr) dummy load or two ?.  It does not have to handle more than about half a watt.  Even a couple of atteunators of about 20 or more db may be used.
There are two ways to tune the duplexer, with and without the return loss bridge.  It helps to know what kind of duplexer.  Is it just a notch type, or a bandpass/band reject ?
Youtube has some using a e8285 or something similar that is very close to the 8924.
This will take you to something I made a while back.  Not very good, but may give you an idea.

Subject: [hp8924] Tuning Repeater Cans

Does anyone know of a tutorial or set of instructions I can use to learn how to use my 8924 for tuning cavities?

The local club asked me if I could assist, and I had to admit I had the equipment but not the knowledge.

Any help and pointers would be appreciated!

-Mike

No problem on the good dummy loads, and I do have a return loss bridge, but it's of questionable quality.

I didn't ask what type of cans they were, the club is moving on to plan b, but I feel that it's something worth learning so I was hoping to pick up some junk cans at a future hamfest to practice on.

I'll take a look at youtube and your link, thanks!

Do a search on this groups files and you should find some answers.
Several years ago there were some posts concerning setting up the 8924
for duplexer tuning.

Hi Mike,

I have an 8920A and have similar thoughts about using it for a variety of projects but nothing seems to be easy! I am using a Mini Circuits combiner as a return loss bridge to do antenna measurements and it works pretty well, but getting everything setup can be daunting!

I agree that there are some good Youtube videos using 892X machines on tuning cavities. I have attempted to use the 8920 on a couple of small UHF duplexers but have never had much luck.

The 8920 is a great box, but all of the RF Tools stuff is on unobtainium 40 pin Epson cards so I haven’t been able to get much help there. I’ve tried to get HPIB going, but haven’t had much luck there either. I have a neighbor who just retired in December after 45 years as a senior engineering from Collins who loves to play around with this stuff, so I’m hoping I can get him to come down give me some pointers. I’m hoping we can get him to get a license because he is a real resource with regard to V/U RF stuff.

Not much going on around here regarding D-Star. Both of the n0cxx systems appear to be working well but they are not used much. I know there are at least 30 radios in town, but most of them were bought a group buy and programmed, but never used.

Maybe this year will be better.

When are the DSM hamfests this year? Have been missing them for sometime. Used to always make the in the fall, but not sure if it even happens anymore.

Jim
Have you gone to the Amtronix.com website?
He has writeups on the 892x's along with some software and hardware for sale. He may have some 8920 compatible cards.
I sent my 8924 to him for repair and calibration. It came back very quickly repaired and caled at a really great price.
Repeater-builder.com is also an excellent site for how to's.
Also go to
"http://www.measurement.net.au/c/25306/1/rf-tools-software.html". They have the software
and cards at a deeply discounted price specifically for hams.
Hope this helps

From: Ralph Mowery
Topic: 2286  Message: 2293

I would not worry too much about the RF Tools.  There is not much on them except the coax fault finder that most would use.  For most of them it is easier just to set up the 8920/8924 series with out them.  There are some cases where doing the same test over and over they may be handy.
Are you using the Minicircuits combiner or one of their directional couplers ?  I have one of each.  The directional coupler works very well for me.  It is a ZFDC-20-5.  That is for return losses and the combiner is for the coax fault finder. I have not used it for that yet.
It may just take someone to show you how to setup the 8920 (assuming it has the tracking generator and spectrum analyzer option) as to how to tune up the duplexers.  It is very easy once you get the hang of it. I have tuned both the bpbr and notch types.  Even without the SA/TG you should be able to get them very close.  Several good vids on youtube about that using a similar E8285 (may have the numbers wrong).  You do need some good double shielded cables like the rg-400.

From: Adam Farson
Topic: 2286  Message: 2294

Hi Jim,

I have successfully used a Mini-Circuits ZFDC-20-5-N directional coupler with N fittings as a return-loss bridge with my 8935. A friend of mine is using one with his 8921A.

Amtronix still offer RFTools on an Epson card at a reasonable price; you might try them. They also offer an upgrade service to convert an 8920A into an 8920B, which has the PCMCIA slot. 11807E Opt. 100 cards are available via popular auction sites. Bob Atkinson in the UK may still offer this card.

Subject: RE: [hp8924] Tuning Repeater Cans

Hi Mike,

I have an 8920A and have similar thoughts about using it for a variety of projects but nothing seems to be easy! I am using a Mini Circuits combiner as a return loss bridge to do antenna measurements and it works pretty well, but getting everything setup can be daunting!

I agree that there are some good Youtube videos using 892X machines on tuning cavities. I have attempted to use the 8920 on a couple of small UHF duplexers but have never had much luck.

The 8920 is a great box, but all of the RF Tools stuff is on unobtainium 40 pin Epson cards so I haven’t been able to get much help there. I’ve tried to get HPIB going, but haven’t had much luck there either. I have a neighbor who just retired in December after 45 years as a senior engineering from Collins who loves to play around with this stuff, so I’m hoping I can get him to come down give me some pointers. I’m hoping we can get him to get a license because he is a real resource with regard to V/U RF stuff.

Not much going on around here regarding D-Star. Both of the n0cxx systems appear to be working well but they are not used much. I know there are at least 30 radios in town, but most of them were bought a group buy and programmed, but never used.

Maybe this year will be better.

When are the DSM hamfests this year? Have been missing them for sometime. Used to always make the in the fall, but not sure if it even happens anymore.

No problem on the good dummy loads, and I do have a return loss bridge, but it's of questionable quality.

I didn't ask what type of cans they were, the club is moving on to plan b, but I feel that it's something worth learning so I was hoping to pick up some junk cans at a future hamfest to practice on.

I'll take a look at youtube and your link, thanks!

# 2295. Re: Tuning Repeater Cans

Yahoo group: hp8924
Date: 2016-01-04 19:15:12 UTC
From: rhyolite@...
Topic: 2286  Message: 2295

You might start with getting the tuning instructions from the duplexer manufacturer. Get the model number and start with that.

I have never used a RLB when tuning duplexers. I use a couple of 3 dB pads to improve the test set return loss and a good 50 ohm load to terminate the antenna or other port. The 3 dB pads are each attached to the generate and spectrum analyzer ports so that the filter "sees" a good 50 ohm termination.

Use top quality cables and N connectors (or BNC) where possible. Using these same cables, use a barrel connector to calibrate the generator and analyzer to a zero reference level (top graduation line on screen). Use the highest generator level and greatest attenuation of the analyzer that will match the top line. This way you have enough signal to see the depth of notch.

If the cavities can be disconnected *, I tune each cavity pass band first, then tune the reject, then carefully fine tune reject with the pass band knob. This so I can see the depth of the notch for each filter separately. Then connect each pair of cavities and check the insertion loss and reject notch depth. Do this for the high side and low side, then connect all together and check each branch from the antenna port while the opposite port is terminated to 50 ohms.

If the insertion loss is excessive or notch depth insufficient (read specs) start over and pay attention to interactions of passband and reject tuning.

* The inter cavity and junction cables are almost always a critical length, so should be noted before disassembly where they belong.

There is a video available that describes 8920 test set operation and tuning a duplexer. You should download that.

Topic: 2286  Message: 2296

I should add, that if it is one of those mobile type duplexers, it is all a reject notch tuning and you tune for minimum signal/maximum notch depth. Those duplexers are not much good on a communications site however.

# 2297. Re: [hp8924] Re: Tuning Repeater Cans

From: Ralph Mowery
Topic: 2286  Message: 2297

While I doubt it will really make much if any difference in tuning a duplexer with a RLB you should try it.  Many of the band pass cans will have a broad tuning range.  On many cans I can give the tuning knob a full turn or so and hardly see any change when just looking at just the maximum signal, but with a RLB it is easy to see even 1/4 of a turns effect on the tuning.  It also keeps the impedance of the system at 50 ohms where just tuning for max signal may not.
I am not sure when the RLB started to be used by many to tune things outside of the factory, probably due to the cost.  Now the cost is reasonable for many to have.  A Minicircuits can be bought for less than $ 100 and for tuning it works as well as the ones that are sold for over $ 200.
I did play with a RLB using a seperate signal generator and service monitor set up as a receiver to see if it was workable,and it seemed to be a way to go if one does not have the SA/TG.

Hi,
There are two "RF Tools" one is the original HP software ona a card (11807A Epson, or 11807E PCMCIA, option 100) and the newer software from Australia. For actually tuning diplexers and filters the HP software does not help as it is too slow. Where ir does come in is to measure the performance. You can normalise the setup (RLB attenuators , cables) against a short and accurate load and thus get accurate performance figures.
I have copy 11807E opt 100 cards available, $60 inc shipping.

Robert G8RPI.

Date: 2016-01-10 15:21:04 UTC
From: wallydoc@...
Topic: 2301  Message: 2301

Just a conversation.
I have noticed that on the RF screen on my HP8935 E6380 HF power measurements are quite high over about 30W, I believe this is normal from other conversations.
I tried the CDMA screen and it seems that I can get good watt measurements up to 100W.
The measurements seem to agree with measurements on my radio, TenTec Jupiter and other Power/SWR meters.
Any Comments?
Wally KC9INK

What frequency? What mode, AM, FM, CW, SSB? How are you connecting the RF source?
The 89xx series except for certain versions are not very accurate
in the HF range. Using a good Power meter that has the ability
to measure in the 30-100 watt range will give you a base line to
compare to the reading you are seeing on the 8935.
Ralph, W7HSG

I'm having a problem with an 8935. Bootup gets stuck at the diagnostic screen. Wish Yahoo allowed attachments I'd send one. But fans come up, first screen comes up then the bootrom diagnostic runs and after a while the demod noise from the speaker stops, as usual, but normally that's the point where the operational screen appears, but in my case it doesn't. The troubleshooting guide takes me to "is there an error message?" well, no, technically, then wants me to run the functional diagnostics, which I can't do since it is frozen. So...anybody have any suggestions as to where to start looking?I guess next I'll remove the external cover and look for error lights.

Hi George,

The attachment did come through. It looks as if the POST process hangs at the end of the Bootrom diagnostic.

You could also try unplugging, then re-seating boards in the processor area.

Can you try a reset? Here are the HP/Agilent reset instructions.

---

How do I reset my Agilent 8935 when it locks up?

The reset procedure for the Agilent 8935 series of base station test sets (E6380, E6381) is:

1. Turn the unit off.

2. Press and hold down the 7 and 9 keys while turning the unit on.

3. Release the keys when the first screen appears.

Note: If the Agilent H7295SA, User Interface with Remote Test Capability, for the Agilent E6380A was being used, the test set may appear locked up because it is expecting signals on serial port 11. If this is the cause, connecting a serial cable to port 11 and running the Agilent H7295SA software will unlock the test set. If neither procedure unlocks the unit, it may need servicing.

---

It would also be worth reseating any socketed chips (EPROMs etc) on the processor and memory boards. SorryI can't be specific, I've a 8924 not a 8935. No need to remove them completly, just ease up one end slightly then press it back down in the socket (both ends) Robert G8RPI.

Subject: RE: [hp8924] 8935 problem

Hi George,  The attachment did come through. It looks as if the POST process hangs at the end of the Bootrom diagnostic.  You could also try unplugging, then re-seating boards in the processor area.  Can you try a reset? Here are the HP/Agilent reset instructions.  How do I reset my Agilent 8935 when it locks up?  The reset procedure for the Agilent 8935 series of base station test sets (E6380, E6381) is:  1. Turn the unit off. 2. Press and hold down the 7 and 9 keys while turning the unit on. 3. Release the keys when the first screen appears.  Note: If the Agilent H7295SA, User Interface with Remote Test Capability, for the Agilent E6380A was being used, the test set may appear locked up because it is expecting signals on serial port 11. If this is the cause, connecting a serial cable to port 11 and running the Agilent H7295SA software will unlock the test set. If neither procedure unlocks the unit, it may need servicing.  73, Adam VA7OJ/AB4OJ  From: hp8924@yahoogroups.com [mailto:hp8924@yahoogroups.com]

Subject: [hp8924] 8935 problem [1 Attachment]  [Attachment(s) from george@... [hp8924] included below]

I'm having a problem with an 8935. Bootup gets stuck at the diagnostic screen. Wish Yahoo allowed attachments I'd send one. But fans come up, first screen comes up then the bootrom diagnostic runs and after a while the demod noise from the speaker stops, as usual, but normally that's the point where the operational screen appears, but in my case it doesn't. The troubleshooting guide takes me to "is there an error message?" well, no, technically, then wants me to run the functional diagnostics, which I can't do since it is frozen. So...anybody have any suggestions as to where to start looking?I guess next I'll remove the external cover and look for error lights.  GeorgeCW2DB

Well, as luck has it my Torx drivers won't fit in the holes on the front panel. So off to 'depot tomorrow to get hold of them. I did run diagnostics on it. Fails on audio analyzer like lower .155 upper .190 actual v dc 7.341. Mist are a bit over 7 volts, so need to dig into the docs on that but also noted that it was hanging up again but I powered down, rocked back and forth, tapped, etc and when I powered it up it will run to operation mode every time. Once it even decoded the local radio station just gave very incorrect modulation readings...I actually think I have an audio card for one of these I bought by mistake a few years back. But the fact that rocking it side to side made a difference really suggests a poorly seated card.

And one more thing that is now leading me to think I have a serial bus problem, error code 0200, which is serial bus, in diagnostics the serial port fails, three modules (audio ana 1 and 2 and mod distribution) all showing failure and this one I overlooked before, in Instrument Configuration there is a display of calibration date, or something like that, which is now all zeros. So it will be interesting to get the covers off and see if anything is loose or just plain not working. I do have two other units I can steal modules from to test though I'd hate to do board swapping and popping something in good boards because of some screwy problem, but we'll see.

I have had excellent results using a GBS8219 Video Converter with the 8924C and a VGA display.

Simply connect the Composite Out from the 8924 to the G/Y connection on the 8219, adjust the vertical and horizontal size and position, and all is well.

The 8219 can be had on ebay for about $160.

It also works well with my HP 8753C.

Hi,Yes, I think I was the first to try one of these, several years ago. They work well, but need a sync separator. The LM1991 works well. Some versions also need resistors added. There is plenty of informatin in the archives. Both this and the 8219 mentioned use the same upscaler chip so if programmed correctly the sync separator would not be needed,  but the processor on the (early versions at least) 8200 does not support sync on green fully. I've seen other applications where the processor was hacked, but I found it easier to just add the LM1991. There is plenty of info in old meassages and the files section.

I did set up one of these, but it was tricky.

I added a 1K resistor from the Green input to the Sync input (on the connector with the 5 large pins) to get the sync signal to register.

But it took a lot of fiddling with the "Clamp" settings to get it stable.

The 8219 was almost "plug-&-play".

Hi,
I initially got it working with RC coupling of the green to sync but it was not very stable.
An external sync separatoer worked much better. I find it interesting that they charge $130 more for a resion in a box and slightly different firmware. Different target maket who need a solution and $160 is cheap to get an expensive machine running where a new CRT monitor is unobtanium.

From: ku4pt@...
Topic: 2326  Message: 2326

Are there any boards on the 8924C that can NOT be swapped with out recalibration . I know the power would need calibration if the input power rating is different.

I bought 2 units at a good price. One was working and the other is a parts unit with the power supply missing. I do have another that I have had for a number of years and it works fine. Just could not turn down the others at the price I got them for.

Hi ku4pt

I purchased 4 and got 3 going via board swapping, eBay spare board purchases & replacing bad tantalum SMD & electrolytic caps.

Rule #1 - RTFM :-) <- specifically page 73 of the HP 8924C Assembly Level Repair Guide. Or if you want to do it the right way, start from page 49 - Troubleshooting. Also, if you are just going to use the 'repaired' unit for ham radio, you can swap most modules and simply perform the periodic calibration which is outlines on page 113 onwards.You'll need a very accurate digital DC voltmeter/multi-meter, bunch leads & adapters, some attenuators (3dB I think) and a good frequency reference (a 10MHz GPSDO / GPSTM is ideal).

Rule #2 - See rule #1. Actually, these HP manuals can seem disjointed and painful. But I have found them essential for repair. Also pays to remember allot of what is inside the 8920 also is in the 8924. HP also released allot of circuits for the 8920 - again many are relevant to 8924. They called it 8920 Component Level Repair Packet.

From: Ralph Mowery
Topic: 2326  Message: 2328

Thanks for the manual reference.  I think I have that down loaded and will look at those pages.  I have the attenuators and have ran a calibration on the one that I have had for years.  Will do that on the 'new'  one.
As this is just for ham use getting close is good enough.  I did compare the old one by receiving wwv on 20 MHz and it counted 20 and all 0's and about once a minuet it would drop to 19 and all 9's.  Out of 3 units they are less than 80 HZ high or low from each other at 999 MHz.
I was just going to take the modules out of the parts unit and swap them into a working unit to check them out as the parts unit is missing the power  supply.  I might just take the power supply out of a working unit and put it in the parts box first.  Just wish there were not so many screws.  I am using a battery powered drill to remove them.  I think I have a battery screwdriver around somewhere to put them back in with.
Yes on the 8920 books being almost like the 8924.  The 8924  operation book is almost useless for anything but cell phones.

I purchased 4 and got 3 going via board swapping, eBay spare board purchases & replacing bad tantalum SMD & electrolytic caps.

Rule #1 - RTFM :-) <- specifically page 73 of the HP 8924C Assembly Level Repair Guide. Or if you want to do it the right way, start from page 49 - Troubleshooting. Also, if you are just going to use the 'repaired' unit for ham radio, you can swap most modules and simply perform the periodic calibration which is outlines on page 113 onwards.You'll need a very accurate digital DC voltmeter/multi-meter, bunch leads & adapters, some attenuators (3dB I think) and a good frequency reference (a 10MHz GPSDO / GPSTM is ideal).

Rule #2 - See rule #1. Actually, these HP manuals can seem disjointed and painful. But I have found them essential for repair. Also pays to remember allot of what is inside the 8920 also is in the 8924. HP also released allot of circuits for the 8920 - again many are relevant to 8924. They called it 8920 Component Level Repair Packet.

Re: [hp8924] Re: board swapping Hello,

Thursday, January 28, 2016, 18:13:34, Ralph Mowery ku4pt wrote:

?
As this is just for ham use getting close is good enough. ?I did compare the old one by receiving wwv on 20 MHz and it counted 20 and all 0's and about once a minuet it would drop to 19 and all 9's. ?Out of 3 units they are less than 80 HZ high or low from each other at 999 MHz.

I was just going to take the modules out of the parts unit and swap them into a working unit to check them out as the parts unit is missing the power ?supply. ? I might just take the power supply out of a working unit and put it in the parts box first. ?Just wish there were not so many screws.
_'_·_'___

It is a good idea to read calibration EEPROM from "donor" unit to file and write down serial numbers of modules from this unit. It will allow you to restore everything to original condition if something will went wrong. I hope you have some programmer that can work with 28256 parallel EEPROMs. I done this with my own 8920 once I disassembled it first time, but, fortunately, never had need to use this backup. ;)

Actually, there is a way to read out factory cal parameters using built-in IBASIC, and it is not a very big problem to find names of all cal parameters from firmware dump (there is a LOTS of them inside). Some of calibration parameter names is self-explaining, but not so much. I was unable to completely figure out which data is related to which module. Tried to find original factory calibration data cards (provided with factory spares) for at least some of modules to see list of parameters related to particular module, but was not very successful. All I was able to find was cal card for 8920 RCVR SYNTH that already was reformatted after repair and used to store some tests.

Just Google "8920 Component Level Repair Packet".

The first item should be the PDF file that you want.

Interestingly, although most of the info is designated as for the 8920, near the end are some schematics specifically identified as for the 8924. It is assumed that this an updated document, and the "8920" schematics apply to both units.

You should have found a PDF file from exodus.poly.edu.

Try Googling " HP 8920 CLIPS.pdf
http://exodus.poly.edu/%7Ekurt/manuals/manuals/HP%20Agilent/HP%208920%20CLIPS.pdf ", if the direct link doesn't work.
That should bring up links to at least two locations for the PDF file.

# 2335. HP8924 Power Supply Success

Yahoo group: hp8924
Date: 2016-01-31 22:51:50 UTC
From: Mike Besemer
Topic: 2335  Message: 2335

Just wanted to pass along a word of thanks to those who have documented the repair of the HP8924 power supply.

I was disheartened yesterday when -8924 would not power up. Having seen this issue talked about in this forum before, I knew to check the LED on the back of the unit. It was on - but dim - especially compared to my other -8924.

It took a good 15 minutes of screw removal to get the power supply out, but when I did I immediately saw a bit of crusty gunk under C5 on the 15 volt standby control module. I just happened to have an identical capacitor in stock, so I replaced it and the problem was solved. Total time from discovery of the bad -8924 to replace the cap was under an hour.

As long as it's apart, I'm going to blow the dust out of it and look for other leaky caps, but this repair was a snap.

I just did the same thing… pulled most everything and blew/sucked it clean. I’ve got everything back in it and the inner cover installed. It powers on, boots, and passes self-test, so as soon as I catch my breath I’ll put the cover on and get back to life.

I used my cordless to take all the screws out, but like to put them back in by hand. I’m just thrilled that (for once) it was an easy fix.

It's not too difficult.

The battery is on the board that has the floppy disk on it.

Just take out that board, and the replacement task will be easy.

Topic: 2340  Message: 2340

Hi,
The battery is easy to replace, It's on the memory board that has the PCMCIA Card slot.
it'a 23/A 3.0V (Lithium Manganese Dioxide) These are becoming hard to find, but Mouser stock them for US delivery only. You can find 3.6V Lithium Thionyl Chloride cells in 2/3A, which are fine electrically BUT all the ones I've found had REVERSED POLARITY compared to the 3.0V cells!
Double check when fitting. The CMOS does not hold calibration data so you don't have to use a back-up supply when changing it.

# 2341. Output power

Yahoo group: hp8924
Date: 2016-02-06 00:55:19 UTC
From: ku4pt@...
Topic: 2341  Message: 2341

I have 2 of the 8924Cs. Testing them against each other I have noticed that when sending power out of either the duplex port or the RF IN/OUT port that the measured power will stop at one point but the display will keep on going for another 5 to 10 dbm. That is the measured output will stop going up at 4 dbm but the display of the driving unit will keep going to about 18 dbm.

Both units seem to do about the same. At first I thought it might be because I replaced the input from a 3 watt unit to a 60 watt unit and used the calibration card to reset the first unit I had. However both units do the same thing and driving from the duplex out ports do the same thing.

Is this normal ?

My 8920A does the same thing. Every time I need signal levels over 0 dBm, I check actual level that can be obtained with my Rigol SA. Then I think about writing it down somewhere together with amplitude corrections below 30 MHz (my unit is with electronic attenuator) to avoid extra work next time... And it was never done because I forgetting about it every time. ;)

Hi,The specification for the 8924C signal generator output is -10.5dBm for the RF IN/OUT port and +3.5dBm for the Duplex/RF out only port. Any setting beyond these levels is uncalibrated.Just because you can set it does not mean it's within specification.

Thanks Robert.
I knew the specifications for the output were below what the 8924C  was showing up on the display.  It just seemed odd to me that it would let me set it for a value that was out of range.  Especially if I go way high it gives me a warning.  I thought I may have been missing something like the way it shows how to do a power offset on the configuration screen or maybe when I did the update to the software when I put in the upgrade to the 60 watt atteunatior in one of the 8924Cs.  73

# 2345. Rf in/out port over power e8285a

Yahoo group: hp8924
Date: 2016-02-11 05:46:12 UTC
From: k0uc@...
Topic: 2345  Message: 2345

I may have inadvertently transmitted too much power to the RF in/out at some pont.

Symptoms are that output from the port is like 20dB low and it reads rf input too low. Like mW for a couple watts in.
Everything else seems ok.

Is there an RF fuse on that port? Seems like like that's what might be going on

Brady

Hi Brady.

I find this is not uncommon ( to input too much power ). It sounds like you have fried the components in the input module.

You can replace the surface mount components if you have the tools.

Compare the input between the rf in out to the duplex input. They should give you similar readings. If not then you need to do the above repair.

Regards

Peter.

I don't know about the 8285 but if it is like the other HPs of the same type such as the 8924 there is an atteunatior between the RF in/out port.  If so sounds like it is blown. It is about the size of a postage stamp and maybe as thick as two or 3 coins.

Thanks Ralph.  That would match with the symptoms.
Then all you have to do is find a replacement and install it.  ;)
I'll be glad if that's all it is.
Shipping the E8285a beast to be repaired is risky and spendy.  Hope it's something I can repair.
Once I do get it repaired some sort of external attenuator is going to go on that port permanently to prevent this in the future.

Hi,
on the 8920 and 892x the power attenuator is a module separate to the input module. It has a "fir tree" heatsink and sits on the lefthand side of these test sets. Take the cover off and trace the coax from the RF in/out. Hopefully it's just the attenuator, but very high power can damage the front end before the power attenuator smokes. If the diplexer input is OK there is good chance it's just the power attenuator.

Robert G8RPI.

Thanks Ralph.  That would match with the
symptoms.
Then all
you have to do is find a replacement and install it.
 ;)
I'll be glad
if that's all it is.
Shipping the E8285a beast to be
repaired is risky and spendy.  Hope it's something I
can repair.
Once I do
get it repaired some sort of external attenuator is going to
go on that port permanently to prevent this in the
future.

e8285a

I
don't know about the 8285 but if it is like the other
HPs of the same type such as the  8924 there is an
atteunatior between the RF in/out port.  If so sounds like

it is blown.  It is about the size of a postage stamp and
maybe as thick as two or 3 coins.

in/out port over power e8285a

I may have inadvertently transmitted too much
power to the RF in/out at some pont.

Symptoms are that output from the port is like
20dB low and it reads rf input too low.  Like mW for a
couple watts in.
Everything else seems
ok.

Is there an RF fuse on
that port?  Seems like like that's what might be going
on

Brady

The front end of the E8285A is not internally like the 892x series. There is no separate RF attenuator. It is built into RF I/O module (E8285-61856 or E8285-61860). Refer Agilent Assembly Level Repair Guide - page 254 for block diagram. Sorry to say but looks like you have cooked the power slitter. Also sorry to say but I don't think simply replacing the cooked resistors will get it up and running 'accurately' again for lab use - without a proper HP calibration. However I would think you should be able to get er up and running OK for HAM radio use.
Have a hunt on fleabay for a parts unit. I picked one up for under US$200 - quite a few out there with crook power supplies or plasma screens. 73s om de chris zl1cvd.

Brady, do you have the "Assembly Level Repair" manual E8285-90033? And/or have you tried the SERVICE7 RF Diagnostics? Crazy thought, did anything change on the units configuration screen? Output port and input port at 0.0..??

Also, there is a difference between the RF IN/OUT and Duplex OUT and RF IN/OUT and Ant IN. Mine is like 10db difference, though I only briefly used the unit before packing it to move to a different home. It might be other than 10db, maybe 22. But it's noticeably different. Ex. Antenna connected to RF IN/OUT and receiver set to NOAA WX. Somewhat noisy. Move ant to Ant IN, full quieting. The service info shows some attenuators and internal paths having about 10db difference. (page 254)

How much power did you get into it. That port is rated 2.5 Watts. Ant IN can't see any appreciable power level, over power there will give an alarm.
Also note the RF I/O assembly, where the attenuator lives, is on the bottom. Turn it over and looking at the front panel it's the long assembly on the right. Coax relay to its right in the back.

You may have all this info, but in case you didn't...

George and Chris...I see in the manual the power splitter and suspect its that or the relay.  And it sounds like maybe(?) It isn't a too terrible to get at the RF I O board.  I don't really care about measuring RF levels so much, so I may be able to get by without that  RF port completely for now.
And yes..it is just a hobby unit for me so lab accuracy isn't necessary.
I just ordered a 20dB 25watt attenuator to use from now on as protection on the duplex port.

Thanks to everyone. ..great group here!73 BradyK0UC

So other than measuring power, when is the RF in/out port essential?  I can pad down the Antenna port for inputs is needed. I may try to live without it.  The other 2 ports seem to cover my needs
Also..to remove the bottom cover of the E8285A. .. remove all 20+ screws on the bottom panel or do you need to do other disassembly first?

# 2357. 100 watt input conversion

Yahoo group: hp8924
Date: 2016-03-10 18:05:00 UTC
From: ku4pt@...
Topic: 2357  Message: 2357

Just wanted to thank the person that put in the files of how to change the 3 watt input to a 100 watt input.

I had one 8924c that I converted several years ago. I paid about $ 200 for the chip and 'rent' on the card to program it for 60 watts.

I bought a 20 db 100 watt chip for about $ 25 and someone had already put in the files section the program to program up a memory card like I have to do the conversion.

From what I read years back I think to make it a true 100 watt unit I would need to change the heat sink,but for a very short test it should be ok as the 60 watt unit is rated for around 100 watts for a few seconds out of every minute.

Checking the two units from about 30 to 1000 mhz they track to less than 1 db on the in/out port over much of the range.

# 2358. 8924C and 8922S board swapping

Yahoo group: hp8924

Is the spectrum analyzer of the 8924C and 8922S the same or different ? I have a parts unit of the 8924 that seems to work except it does not have a power supply (swapped in one from a good 8924 to test).

I have a 8922s that works but does not have the spectrum analyzer module. Before I remove the '500' screws to fine out if they will interchange someone make know and save me the effort if they won't.

I looked at some parts lists and seems some modules will and some may not.

# 2359. Re: 8924C and 8922S board swapping

Just looked up my notes and see I stripped the spec analyzer module from an 8922 (HP# 08922-61045) and fitted it to a E8285A and it worked OK. It wasn't an 8922S but I suspect the S makes no difference to this discussion anyway - probably just some GSM front panel layout and other GSM related differences. From memory, and not notes, there were some bandwidth differences but I can't exactly recall if this was an issue or not. Internally, the E8285A and 8924C are very similar - they do use exactly the same spec analyzer module (HP# 08920-61101). So yep, get screwing :-) 73s de chris zl1cvd.

Thanks for the info.  I put the SA from the 8924c into the 8922s.  It fits fine and now lets the SA screen come up, but give an error code of 242 , self calibration failed, whatever that means.
There is no trace across the screen like I think it should be, but it seems to have all the functions , but nothing works.  I will have to look at it some more.  It could be that module is bad, but I am not going to swap it with another I have that is in a working 8924c due to all the screws.Atleast the parts 8924 did not have but 2 screws holding the outer case on.

From: Randy B.
Topic: 2358  Message: 2361

I am new to this group and want to thank the moderator for allowing me here. I have the HP8924C that I hope has just a power supply problem. It worked flawlessly for years and then due to a broken or burned neutral wire in the power cord, it must have got caught in a ground loop shenanigan of some kind.
My question: is there a way I can test the supply or is there a common element that fails that I can replace? Everyone I have talked to says it is a bad capacitor but the ESR meter can’t find one. Any tips or advice appreciated. I’m not comfortable working on this unless there could be a simple remedy or check. I’m using my COM3010 at the moment so I’m in no big rush.

the cap that usually fails is on a daughter card toward the rear of the unit .

It is the standby supply the keeps the OCXO warm and brings up the main supply through the on-off switch.

It should have a green LED in the back if it's even close to working

Be careful in using the green led to troubleshoot. Mine was lit but not very brightly. I might not have noticed if I hadn't had two monitors sitting on top of one another so it was easy to tell the difference.
If the green LED is completely out you may have a bad capacitor.  BUT just because it iss lit doesn't necessarily mean the capacitor is good.

From: Mike Besemer
Topic: 2358  Message: 2366

From message 2335 on 31 Jan 16:

“Just wanted to pass along a word of thanks to those who have documented the repair of the HP8924 power supply.

I was disheartened yesterday when -8924 would not power up. Having seen this issue talked about in this forum before, I knew to check the LED on the back of the unit. It was on – but dim – especially compared to my other -8924.

It took a good 15 minutes of screw removal to get the power supply out, but when I did I immediately saw a bit of crusty gunk under C5 on the 15 volt standby control module. I just happened to have an identical capacitor in stock, so I replaced it and the problem was solved. Total time from discovery of the bad -8924 to replace the cap was under an hour.

As long as it’s apart, I’m going to blow the dust out of it and look for other leaky caps, but this repair was a snap.

73,

Mike
WM4B"

Take a look. If you can use hand tools and solder, you can fix it.

Can you describe the problem? Is the green LED in the back lit? You can see it from the back of the instrument.

I am new to this group and want to thank the moderator for allowing me here. I have the HP8924C that I hope has just a power supply problem. It worked flawlessly for years and then due to a broken or burned neutral wire in the power cord, it must have got caught in a ground loop shenanigan of some kind.
My question: is there a way I can test the supply or is there a common element that fails that I can replace? Everyone I have talked to says it is a bad capacitor but the ESR meter can’t find one. Any tips or advice appreciated. I’m not comfortable working on this unless there could be a simple remedy or check. I’m using my COM3010 at the moment so I’m in no big rush.
Randy B.

Hello group,

This unit does not power up and no ventilation fans are heard when in the ON position.
The rear green LED light is on.
The Standby +15 volts is present.
The ON/OFF pin on J11 of the power supply registers 0 volts in the OFF position and 7.8 volts in the on position. Are these values correct?
With the cover removed, a very low tick or click sound in heard in the power supply which seems to be coming from around the center of the power supply main board with a frequency of one click per second when in the ON position.

I can’t find the schematic for this unit anywhere. I do have the Service Manual which only depicts the power supply A23 pinout.

Please advice as to where I can find or purchase the schematics for the HP 8924C and if anyone in the group experienced this issue, how it resolved.

I appreciate and thank the group in advance for any help you may offer.

Best regards,

I don't believe anyone has ever found a full schematic for the power supply.?

In my case, the LED was lit, but was dimmer than usual.? I doubt that I'd have noticed the dimness in normal room lighting had I not had another -8924 sitting on top of it to compare it to.? If you have a scope, check the standby voltage for ripple.

Hello Mike,

No ripple, Standby supply is solid. The rest of the supply tries to kick on, this can be seen when the output voltages start to raise on every clicking sound per second. Each click is an attempt to turn on. Something is throwing it into protection mode.

Thank you very much.

Best regards,

Jose Hernandez

# 2385. VGA to USB input to computer

Yahoo group: hp8924
Date: 2016-05-03 19:47:04 UTC
From: ku4pt@...
Topic: 2385  Message: 2385

I have finally gotten my GSB8200 board working into the VGA monitor. I have looked around and am trying to find something inexpensive that will take that VGA output and input it to a computer to record the screen in real time. Seems that I can find all kinds of converters from about $ 10 up to convert almost any other video to USB except the VGA .

I do have the program and connection for the single screen snapshot working, but I really want a real time copy of what is going on.

That type of converter, or even better would be one that takes that odd ball video of the 8924C and sends it out as something that will plug into the USB of the computer.

# 2386. 8920B

Yahoo group: hp8924

Topic: 2386  Message: 2386

I have an HP 8920B with Opt 055, which lets it go down to 400 KHz, like the "A" model. I was just testing a few things to see how accurate this unit is.

One of the tests I did was to input a calibrated 0 dBm, 50 MHz reference. Measuring this on the RF Analyzer screen and using the RF IN/OUT, I read -0.2 dBm. This is excellent.

Injecting this same signal into ANT IN, I get no reading, just dashes. There is probably a reason for this, but it escapes me at the moment. If someone would explain, I'd appreciate it.

Now on the the spectrum analyzer. Using RF IN/OUT, I read -1.63 dBm. Using the ANT IN, I read -1.08 dBm. Both of these are more than 1 dB lower than they should be. The reference level is set to 20 dB, so the peak is two divisons down from the top. I read somewhere that this is where you want the peak.

Comments welcome.

From: Adam Farson
Topic: 2386  Message: 2387

On my 8935 E6380A, using a calibrated 50 MHz 0 dBm source, I read -0.27 dBm on RF IN/OUT in the RF Analyzer screen. When I move the source to ANT IN and switch the input to ANT IN, I also see dashes in the Tx Power field. This appears normal.

On the Spectrum Analyzer screen, using RF IN/OUT, I read -0.95 dBm at the peak, with 30 kHz span and 300 Hz RBW. Reference level is 20 dB. Using ANT IN with the same settings, I read -0.55 dBm.

It looks as if the two instruments are pretty close to one another.

I have a 8935 as well and see similar.

I had the impression that the TX Power reading was done via other method tied to the input attenuator on the RF IN/OUT port, rather than a the method used by the SA when setting a marker.

I have not specifically tested, but the TX Power reading appears to a a summ reading of ALL RF, and I know that at least on my unit will happily report a correct power level even if the target freq is a few hundred Mhz off.

# 2389. Re: 8920B RF Power Meter (+8924, E8285A)

Yahoo group: hp8924
Date: 2016-05-13 08:32:01 UTC
From: zl1cvd@...
Topic: 2386  Message: 2389

This is as it should be. The main Peak & Average power detectors (there are 2) are in the A23 input module (8924 A5) and attached to the RF IN/OUT port only (Page 447 & 451 8920 assembly level repair guide). There is one downside here, attenuator A24 (8924 A4), normally 4dB from memory, also attenuates lowest possible power reading. So if you upgrade the input to handle 100W with a 20dB attenuator, lowest possible power reading now is 16dB worse than before.

I believe power on spectrum analyzer is caclulated from ADC IF reading somewhere. Its definitely not as accurate but gets better with narrower bandwidth / span.

I just bought this unit a few months ago. In one of the menus, it tells you how many times each relay has been activated. The numbers are extrememly low. I suspect that the 8920B was upgraded late in life with the Opt 055.

I bought the 8920B to replace an E8285 that I had for a few years. It did everything I needed, but it was a beast. When I rearranged my work room, It was difficult to find somewhere to put the E8285, being 2 ft deep.

I got such a great price on the 8920B that I couldn't resist. And it fits on a shelf above my work table :-)

If it has the Agilent name on it , probably an 800 and up unit. Try setting the freq to anything under it, simple test. However, there are folks that have the firmware "downgrade" to open it up, however, the calibration is pretty off on levels especially around 400-500 MHz, as I recall. (I have done this mod on one). But it works. ZL1CVD, Chris, who I believe frequents this forum that had the replacement Eprom to fix the calibration issue and has the info on opening up the range. The Eprom involves soldering on a SMD chip, though. If that's not for you he can do it for you, all for a pretty reasonable price.

# 2402. Hello all, Need some questions answered

Yahoo group: hp8924
Date: 2016-06-23 00:52:19 UTC
From: ob1kinobi1999@...
Topic: 2402  Message: 2402

I have just bought a nice used 8924C
It had very bad screen burn and I found a brand new in box replacement CRT. its swapped out and works great.
I was trying to hook an external monitor but ran into some issues but found a work around and that works great too. now to actually using the unit.

when I got it it was supposed to be only a 30mhz-1ghz range with a max input of 3 watts. On reading several articles its been said that the range is actually 400khz - 1ghz but anything under the 30mhz range may be off on the accuracy if you don't have option 055. also there was mentioned that there was a option 060 for a 60 watt input, reading further another said that the 055 option not only fixed the attenuation levels for the lower frequencies but also allowed for a 100 watt input.

I have not been able to clarify these statements or find any information online about these options. however I did find a very small picture of a heat-sink and some other parts listed as the 055 upgrade.

When I changed out my CRT I noticed that on the side of the CRT (right hand) there was this same heatsink that looks like some kind of high power filtering device and it matches the small image I have. on the top it has 2 or 3 long numbers but one that stands out is xxxxxxx-055 I was hoping this was the 055 option. I would like to know more but online info is hard to find.

As to operating the unit its been fun learning what i can make it do, I have not messed with service monitors in years and didn't have much to do back then. I can set up the spectrum analyzer and can see my signal when I transmit. I can also send a variable tone to the radio from the unit. I have had some trouble hearing transmissions from the radio to the unit but did get it to work once, but it stopped later. I am sure I just have a setting wrong, luckily I have all 5 manuals including the repair manual for the unit. I have trouble reading and understanding some of this technical info. That's why I joined this forum. I do have access to 2 other local techs that have lots of info, they just haven't messed with service monitors in general for years and are not up 100% on what to do.

Any info anyone can provide on the 055 option would be great , also any pictures would be helpful too!

I was wondering if you could send me you hook up diagrams for connecting the hp to the 8200board. I am designing a video modification interface that will have many extra options using this board, but I would like to get a jump-start on converting the 19.2kz signal to VGA to start.

Also you might be able to get a SVGA to RCA adapter ($4 Ebay) and just use a TV Card (USB) to capture with.

# 2404. Memory Card?

Was wondering if a PCMCIA adapter card could be used, I have seen some that can take a sdcard or even compact flash, some even have external capabilities but am unsure if these would work. I have not been able to find any cheaper than about $80 used, would like a cheap alternative. also wondered what all you can do with this , I have the programming manual but havent read into it yet.

# 2405. Re: [hp8924] Hello all, Need some questions answered

Topic: 2402  Message: 2405

When you replaced the CRT to the right of it is a small box with some hard line of about 1/8 inch (you probably want milimeters, but I do't have the conversion handy) going in each side of it.  Inside of it is an atteunator that determines  the power input.  You can change that out to a high power one and it will be good for 60 or 100 watts.  The heat sink for the 3 watt unit is also good for 60 watts so all you have to change is the actual pad inside the box.  You also have to program the 8924c so the calibration will be correct for the new atteunator.  If you look at the files section of this group there are files and instructions on how to do it.  It looks similar to this one on ebay.http://www.ebay.com/itm/New-100-Watt-20-dB-50-ohm-Hybrid-Attenuator-up-to-2-GHz-/370844447103?hash=item56580d317f:g:8mAAAOSwHQ9Wa3DG

The standard configuration for the 8924c has an electronic attenuator  and is only calibrated for 30 MHz up.  It works good to about 15 or maybe even 10 Mhz before the calibration gets way off.  The other option uses mechanical relays and is good to much lower frequencies.  All functions work to the lowe end,but  just the actual power levels will be off.  At Amtronix.com there is some information on this.
Most manuals for the 8924c are useless.  You can download the one for the 8920 series for better information.  You will have to make note of some slight differences.

If you just want to do a screen print, you can do that very easy.  There is a program called something like  BTS utility.  On the back of the 9824 is what looks like an ethiernet connector.  It only has 6 pins, but wiring that up to a standard rs232 connector and plugging it into a computer serial port will work fine.

Hi,
No PCMCIA to CF (or SD) adaptors will not work in a 8924 or 8920B. The HP test set use linear addressing mode of PCMCIA cards. Most applications including PCs use the ATA hard disk emulation mode. All the adaptors I have found do not connect the mode select pin and I've not found a CF card that supports linear mode anyway. SD has never had linear addressing.
Some industrial PCMCIA cards will work but the NVRAM ones are expensive.

Hi,
search old message and the file section for information on using the Gonbes adaptor. On thing to note is the sync input is not rated to 5V input so if using a LM1881 or 5V comparator for a sync separator you need to add a series resistor.

Hi,
Welcome to the group.
As Ralph has mentioned, read the 8920A and 8920B guides and manuals if you want to use it for analogue radio. The 8924C is basically a low power input 8920B with a CDMA test set built in. The 8920A guides are a bit more introductory. All the 8920B features are there, just some buttons and menus are different. If you lost audio on receive you probably sent it to the analyser rather than the speaker.
I prefer to use an external power attenuator rather than modify the internal one. It keeps the heat out of the box and gets you out of the habit of connecting a transmitter directly to the test set which can cause damage if you get the wrong socket.
You can add an off-set in dB to the input/output port (setup screen) so all the readings are correct. This even allows you to use an odd value attenuator which are often a lot cheaper surplus than a 10 or 20dB unit.
The "55" on the part number is coincidence, there is no connection with option 55. Options are marked on a plate on the rear panel.

Robert G8RPI.
p.s. I have the RF tools on PCMCIA card for sale if you need to use them.

If you have the spectrum analyser band width set too wide, the audio demod turns off. It is normal. The manual explains this.

I modified both of my 8924c to handle the higher input.  One was the 60 watt factory replacement and the other was just a 100 watt rated attenuator , don't recall how many db it is but from one in the files section.
I agree that it is much better to use an external one to help prevent plugging a transmitter into the antenna or duplex out port.  I have a big 250 watt dunny load with a tap on it that I usually use with the transmitters.  I just thought the high power input may help me from blowing the 8924 if I accidentally  transmitted while checking a receiver.

I prefer to use an external power attenuator rather than modify the internal one. It keeps the heat out of the box and gets you out of the habit of connecting a transmitter directly to the test set which can cause damage if you get the wrong socket.You can add an off-set in dB to the input/output port (setup screen) so all the readings are correct. This even allows you to use an odd value attenuator which are often a lot cheaper surplus than a 10 or 20dB unit.

You can use 'almost' any PCMCIA card in the 8924 series.
Mine uses a CF card, and it is a 4GB capacity. Used to store screen shots for site surveys.

Actually, anything above 1.50 mHz. will cut off the internal speaker.

I prefer to use external attenuators, so I have a lot of 100 Watt units, from 3dB through 20 dB. Even one at 30, but it is rare to have a need for this amount of attenuation, especially for LMR use, and almost never at a cell site.

Transmitting up the RX or Duplexer ports causes damage. With an external attenuator you never connect a TX directly to the test se so are less likely to make the slip. There is no difference in performance with an external attenuator, the offset dB function applies to both directions of the port so you don't have to do any mental math.
I've just repaired a 8920A that had been transmitted up for a friend. I dont know what the power was but it took out two PIN diodes, twoo attenuator sections and a couple of resistors. Fortunatly I had an input module from a 8922x and was able to to rob the required parts from it.

Hello all,
I have had an HP 8924C for 4 years and use it somewhat frequently. A couple of weeks ago, I turned on the power switch, and nothing happened. I have not moved it or changed anything. I checked the power at the end of the AC power cord and it is OK. I assumed the power supply, so I got a known good replacement. Same thing. I don't see an led lighting, and nothing is happening. I am suspecting the power switch. Can it be tested at the power supply connectors? There is a lead marked, "ON/OFF" and another marked "LINE SYNC." Can you power it up around the front panel switch?

How do you get to the switch to check it, or replace it?

Am I missing anything else. Any other suggestion gratefully accepted.

Can you point to exectally which CF pcmcia card you are using ?
I have a 512 MB card and it will not read or write to it.  The card works in a computer because I can write to it and read back from it.  The 8924 tells me that the card needs to be initilized  and it can not do that because it is write protected.
I know the 8924 works because I have 2 types of pcmcia memory cards and they both read and write.One has a battery and it has to be replace about every year if I want to use it.  The other card has an on board battery that is recharged from the 8924c while in the slot.

Look in the back of the 8924 on the lower left side as you look at it from the back.  There should be a round hole and a green led should be lit up with it plugged in to the AC.  If not either you are not supplying power to the 8924 or the power supply is bad, even if you think you have a known good one.  The switch has nothing to do with that led.  It will come on with the switch off or on anytime there is AC power to the 8924.
Several years ago I had one that was slow to turn on so got a rebuilt one from Amtronix.
 The led would  not light up on that one and I called them and they sent me another.  It worked fine after that.

Hi Ernest,
Exactly which adaptor and CF card have you used in the 8924c? I've tried loads with little luck
As far as I know the 8924C will only write to RAM, not Flash. I've never seen a RAM CF card so am interested to know how you use a CF card to store screen shots.

Regards,
Robert G8RPI

Glad you got it going Gene.  Seems that many of the 'computer' problems can be cured by reseating the cards.
I hope you tried the supply before you replaced all the screws in the cabinet.  When I replace the supply in mine the first time, I did not test it and had to remove all the screws for a second time.
 Where I worked we often had to reseat cards in the various instruments.  One room had about 20 cabinets  that had about 8 to 16 cards on each row and about 8 rows.  Lot of plug in cards that could have a bad connection.

Ralph -

I am old time phone company, so reseating was one of the routine early repair tricks. Once I reseated the connectors on the PS and the chassis, it fired right up. I did put the old supply back in, just to see, but it did not come up. I will open it up and see if I can find out what is bad and fix it later. I counted 8,354,120 screws taken out, and only 12 left over, so I guess I did not do too bad.

Thanks for your advice!

I would have to check, but if this helps, the card has an image of a Dolphin, or some type of marine 'fish' on the card.
The PCMCIA adaptor is a little-known brand. Neither are with me today.

Can you point to exectally which CF pcmcia card you are using ?

I have a 512 MB card and it will not read or write to it. The card works in a computer because I can write to it and read back from it. The 8924 tells me that the card needs to be initilized and it can not do that because it is write protected.

I know the 8924 works because I have 2 types of pcmcia memory cards and they both read and write.
One has a battery and it has to be replace about every year if I want to use it. The other card has an on board battery that is recharged from the 8924c while in the slot.

You can use 'almost' any PCMCIA card in the 8924 series.
Mine uses a CF card, and it is a 4GB capacity. Used to store screen shots for site surveys.

Always use the type 'N' conbector for RF measurement. RX can be handled best through the ANT. port, then the duplex port if testing split channel radios(duplexed).

A.E.C RADIO
On Jun 23, 2016 10:15 AM, "robert8rpi@yahoo.co.uk [hp8924]" <hp8924@yahoogroups.com> wrote:

Transmitting up the RX or Duplexer ports causes damage. With an external attenuator you never connect a TX directly to the test se so are less likely to make the slip. There is no difference in performance with an external attenuator, the offset dB function applies to both directions of the port so you don't have to do any mental math.
I've just repaired a 8920A that had been transmitted up for a friend. I dont know what the power was but it took out two PIN diodes, twoo attenuator sections and a couple of resistors. Fortunatly I had an input module from a 8922x and was able to to rob the required parts from it.

How did you get the 8924 to display a sub-audible spectrum and why would you expect a sub-audible carrier to be able to support an audible modulation???

mHz - milli Hertz, MHz = Mega Hertz.

The analyzer does not accept a wide band signal with audio. I routinely display a far narrower bandwidth (less than 100 Hz.) for signal quality. The speaker gets cut off once you exceed 1.5 mHz. Too much bandwidth to decode.
A speaker us useless for me at the frequencies I look at, as I am far more interested in sine wave quality and signal accuracy and levels, such as a VCO output. Any audio impinging on such signals ruins the measurement.
I desire a pure carrier. Audio is of no concern.

The problem with the supply is probably not obvious.
If like others switching supplies, the problem is aluminum electrolytic capacitors that have excessive ESR.
If mine I would replace all of the aluminum electrolytic capacitors with ones rated at 105 decrees C and rated for high ripple current.

Unless you like to remove the supply and replace the capacitor that you test as bad.

It is like rebuilding a car engine.
You do not go in and replace the one faulty ring, you replace all of the rings and be done with the job.

I do have a 500watt 50 ohm dummy load that looks similar to that attenuator in the pic, but it has only 1 solder tab on the side. I was going to take this and use a hi imp. voltage divider(pot) to tap of of for the input signal. but i thought if i was lucky that option would already be installed.

as far as checking the switch, take the cover off and the faceplate, you will have to remove the large nuts on the n and bnc connector for it to come off. took me half an hour to figure that out.

There is also a well-documented issue with a capacitor or two on one of the small, vertical PC boards that is mounted on the main power supply board. Frequently, start-up problems are solved by replacing these capacitors.

This is covered in the "files" section of this discussion group.

# 2432. 8924c will not poer up

Yahoo group: hp8924
Date: 2016-06-24 14:38:03 UTC
From: <wd0giv@...>
Topic: 2432  Message: 2432

Hey all,
My 8924c will not power up. I have read all the post and archives on this. I even bought a supposedly good supply and swapped it, no go. The 15 volt supply is working on both. I have even done the re-seating all boards and no go. I am now re-capping the board behind the display modual and the caps on the mother board behind the CRT display. I took the time to explore the power switch. It is using reverse logic much the way Tektronix does. This was done in the TEK world so if the switch fails your scopes could still be used as they would be "on" always till the switch was replaced. I think HP did the same thing.When the unit is off the switch is closed at some point forcing the supply off. In TEK would this is direct connection to the supply. I am tracing it to see if that is the case in HP. Does anyone know ALL the conditions needed to bring up the supply? Since there is a "program" pin and line sync pins on the supply they may be involved. Any thoughts on a way to bring this guy back to life?
73Richard
ARS  WD0GIV

PS an electric screw driver is a must with this scope.

looking online at those attenuators, i found a nice 250watt 20db for $40
i can mount that in a external metal box with a large heatsink and use that correct?

also i was reading that attenuators in series are additive, so would i add the 20db to whats internal? is this going to be a problem for watts?

Hi,
Yes you can use that on a suitable heatsink. Attenuation is additive. You can either mentally add 20dB to all the readings, or much more easily, if you go into the configuration page of the 8924C you can enter 20dB as an offset to the RF IN/OUT port and all the readings and settings (power meter, signal gnerator, spectrum analyser etc) will be corrected for the external attenuator.

HTH,
Robert G8RPI

It will be fine to get a great big heat sink and mount the attenuator to it.  Just make sure the leads are short and direct to some connectors as not to mess up the impedance.  I assume that is one that is about an inch or so  square and does not come on a heat sink.
When you use an external Attenuator you can keep track mentally by just moving the decimal point over 2 places when measuring watts.  Add or subtract 20 db when using the DB scale, and I leave the voltage to you.
As pointed out you can go to a setup screen and set the 8924 up to compensate for the 20 db of the attenuator.

Not sure what the latest is but know that it is up to 8. something.
The 8924c does almost everything you can think of.  If you don't know it, the books for the 8924c are almost worthless for the operation if you are not looking at a cell phone.  YOu can go to the HP: web site and download the information for the 8920.  The 8924c is very similar to it.  Some of the keystrokes will be different and the buttons may be labeled different.
Go to here and look around.

Hi Steve,The 8924C is basically a 8920B with all the options and a CDMA cellphone adaptor in a big box. As Ralph says thr 8924C manuals are heavilly biased to cellphone use. For specifications especially frequency range use te 8920B manuals. The 8920A user guides and training material are fully applicable one you work out some of the key and menu differences.As far as I know a 100W input was not  factory option on the 8924C, but many users made this modification by fitting the 8920x input attenuator.
What options are marked on the back of the unit?
Robert G8RPI.

yes the green LED was on. I have found the problem and it is a new one. All should take note. The power switch is arranged just like many Tektronix models. The switch is closed to turn the unit off. This makes a switch failure intrinsically in the on or useful state.The switch goes directly to the filter regulator board located behind the CRT and were the power supply tow cables plug into. I baught a working supply and still no luck so I figured the problem had to be on the filter reg board. After extensive search I got a part number and found one on Ebay. sure enough bam the supply now comes up. I had changed all the caps on the board and no luck. there is a few IC`s and other parts on this board. I am continuing to try to find the bad part on the bad board. I have amassed a large amount of documents on this scope and will post when I get time. Should anyone need a spare supply I have one fore sale on ebay as I ended up with three. I am keeping one as a spare.I do not have schematics for the supply or the filter regulator board. I do have circuit theory descriptions and that is how I learned what the filter regulator board does. While no one answered my request for the turn on voltage ,I now have it....wait for it.....+8 volts is used to turn on the supply.This now makes it possible to test supplies outside of the scope. I am going to build a tester/load jig so I can work on them easier. I just read someones post saying the factory did not make any 100Watt units and they were all user modified. Sorry this guy is wrong I found documents from HP describing this option and my scope has the appropriate parts installed right were they are described in the HP docs.

From: Ralph Mowery
Topic: 2437  Message: 2443

Easy to do after spending a month learning how to operate the set..
At the top of the 8924c there is a row of buttons.  Press the one that says TESTS, it is above and just to the left of  the  7 key of the keypad.  You can also get there by going to the bottom right of the screen and selecting the TESTS from there.
Curser  to the 'load test procedures'.  Go to the bottom right and curser to the ROM and press the round dial to select that.
Curser down one space to Select Proceduers Filename.  Go back to the bottom right and go to LISTOPTS.  Select that by pressing in on the dial.  Then press the K1 button just to the right of the screen to Run Tests.
It should then list the options on the screen.

If you have not done it, go to the Amtronix page and see how to set it up so it will come up like you want it to.  Once you get the 8924 set like you want it, you can use the POWERON save and every time you turn the set on it will come up that way.It is under the heading of something like 'make the set turn on like the 8920.
The 8924c comes with many things built into it.  They don't often have very many options as they are not often needed.

# 2444. 8920B Power Supply Problems

Yahoo group: hp8924
Date: 2016-07-26 22:52:03 UTC
From: cahelstrom@...
Topic: 2444  Message: 2444

I have a 8920B that smoked the power supply. Found charred PCB under one of the 5 Volt filter capacitors. Replaced that cap, but supply still doesn't work. Will produce voltages below spec. on all outputs, being powered by AC or DC (therefore doesn't appear to be on the input side of the supply).

5 volt output produces 1.4 v, 12 volt output produces 1 v, +/- 12 volts outputs produce +/- 8 v, and the 40 volt output produces 24 v. It appears the switching circuits are switching, just not at a proper rate to produce
full output.

Anyone run into similar problems and solution, or could point me to a repair service that has experience with these supplies?

# 2446. HP 8935 Backup Battery Issue

Yahoo group: hp8924
Date: 2016-08-06 21:09:12 UTC
From: fwbray@...
Topic: 2446  Message: 2446

Today, my HP 8935 indicated that the memory backup battery was low. This consists of two "AA" batteries mounted in a holder inside the rear cover. Since they were last changed 4 years ago, this wasn't surprising.

I replaced both batteries, carefully observing polarity. While replacing the real cover, I noticed that the batteries were getting extremely warm. After removing the batteries, I determined that the resistance across the output terminals was 0.3 ohms. Further investigation indicates that the resistance between the positive wire running into the unit displays the same resistance value to the chassis. (This is with the negative wire terminal lifted from the chassis.) Perhaps a capacitor on the memory board has shorted?

Since disassembly of the 8935 takes a bit of effort, I wonder whether anyone else has encountered this failure.

I also would like to find a relevant schematic but so far haven't come across one.

Thanks in advance.

KE6CD

From: wd0giv@...
Topic: 2432  Message: 2447

FYI all the power up voltage is 8 volts. This is developed on the filter board the power supply plugs into. The power switch is actually a normally closed switch, normal failure would be open thus turning on the scope. I am not sure if they sum all the correct voltages to get this 8 volts or not.

# 2448. HP 8935 Memory Battery Issue

Yahoo group: hp8924
Date: 2016-08-06 19:53:18 UTC
From: fwbray@...
Topic: 2448  Message: 2448

On power-up my today, my 8935 indicated that the "AA" memory batteries were low. Not surprising as they were 4 years old.

I installed two new batteries, observing polarity. As I was putting the rear cover back on the unit, I noticed that they were getting very warm. I removed them before any serious damage was done, although some plastic around the terminals did get soft. After letting everything cool, I replaced the batteries with another set (again carefully checking the polarity orientation of the batteries) and the same problem recurred.

I surmised that the problem (short) lies in the battery holder, as the small gauge wires that connect the battery holder to the unit are completely intact and undamaged.

I plan to replace the holder but further disassembly is required as it's secured with rivets from the other side of the panel. I don't have time to do this today. However, it is possible that the problem is elsewhere.

Has anyone else encountered this?

Thanks!

# 2450. Re: [hp8924] HP 8935 Memory Battery Issue

Yahoo group: hp8924
Date: 2016-08-09 02:34:38 UTC
From: F. W. Bray
Topic: 2448  Message: 2450

I know that some equipment uses rechargeable ones but here the manual calls for two alkaline cells and that's what I put in 4 years ago.

On further research, I found that the problem is more complicated. The positive lead reads 0.3 ohms to the chassis even with the negative lead lifted. My guess is that there could be a bad component on the memory board inside the unit. Perhaps a capacitor has shorted?

Interestingly, the "AA" batteries are backup for the coin cell mounted on the memory board. There's some type of battery controller but without a schematic it's hard to figure out before I open it up. I'm ordering a new coin battery and a holder and will then open the unit for repair.

Thanks.

Quite possibly an electrolytic or tantalum cap failure is causing the low impedance reading.

Another point to note, the E8285A had similar issues. HP released a 'mod' for this model which is discussed here: http://www.amtronix.com/e8285a_mod.htm
http://www.amtronix.com/e8285a_mod.htm

The 8935's also have a button cell on the memory/sbrc assembly A2A30 - CR2477.

Also to note is the batteries only provide power to non essential stuff in SRAM - if they go flat, you'll lose any saved default setting but the equipment will still work just fine. Not like some early Kenwood transceivers that ended up useless if the batteries went flat.

# 2454. Measuring insertion loss

Yahoo group: hp8924
Date: 2016-08-30 17:04:16 UTC
From: tomasguerro@...
Topic: 2454  Message: 2454

Our duplexer is a Sinclair Q2330e VHF. When we first got it we were told that by rotating the loops we could adjust the insertion loss for times when you might need some extra attenuation or just best performance. Others told us no way but Sinclair confirmed this. But they tune using a network analyzer that I don't own or even know how to use. Any way, we have 6db of insertion loss that shouldn't be more than 1.4. I'm still learning this service monitor. I was able to tune the pass and reject. Can someone suggest how to test the insertion loss? I was thinking (dangerous) that if I use the monitor to generate an on frequency signal and then loop back to the spectrum analyzer and watch the change of the spike. Yes? I am a rookie and don't know quite what to ask.

Thank you.

Tomas Guerrero

On my 8920. Got to SA and set up to tune the cavities. Tracking generator on etc. Take the end of the cables that are attached to your cavities and attach them to each other using a barrel connector. Go to Auxiliary Menu in SA and turn on Normalize then select A-B. The screen should show a solid line at zero dB. Remove the barrel and connect to the cavities and it will show insertion loss in dB.

Hi Tomas,The 8924C is  ideal for this, but does need a bit of set-up. The spectrum analyser and signal generator (in tracking mode) work together to make a network analyser (only scalar, not vector, but that's all you need). See this videohttps://www.youtube.com/watch?v=mLsfyKs9E00

The RF tools software (blatent plug, I can sell you this on a PCMCIA card) automates the process if you want accurate measurements, but the basic function is better for adjusting units.

I always do it that way so I can monitor the loss and pass at the same time. It's kinda a balancing act. Another thing on the older gear, Cushmans, if you changed from the tx pass to the rx pass frequencies you had to recalibrate. I never paid any attention on my HP as I wasn't trying for an exact loss figure.

When changing the loops for loss watch the shape of the pass, you may have to spread out a bit but it's interesting to watch it narrow up.

Amazing machine the HP service monitors. I still find new stuff sometimes, even after owning one for 20 years.

# 2462. Re: [hp8924] Measuring insertion loss

Yahoo group: hp8924
Date: 2016-08-30 20:36:18 UTC
From: Ralph Mowery
Topic: 2454  Message: 2462

It is easy.  Just go to the SA screen and set it for the frequency you want, set the bandwidth to a small value and go to the tracking generate screen and make sure the output is the same as the input of the SA.  You can go to the AUX screen and set it for either 1 or 2 db per devision to get a more accurate display.  While on that screen you can also take the 2 pieces of cable comming from either the output or the duplex output and antenna input and put a barrel connector between them.  Then tell it to store B and then use the B_A function .  This cancels out any loss in the cables.  Then remove the barrel and hook up the duplexer or cavity.
It does take a while to learn how to use the 8924c even if you are familiar with service monitors as it does so much.  There is very little documentation out on that unit that is not for cell phones.  However it is very similar to the 8920 and if you download those manuals and figuer out the differences in the buttons to press it will help a lot.There are many in the files section and you should be able to go to the HP/Agilent web page and find out lots about it.  They did change the name of the HP/Agilent to something else for the test instruments, so it may take a while to find that.  Sorry I don't have the the name handy.
The 6 dB loss is way too much.  Looking at the specs you should only loose about 1.5 but it will only give about 90 db of isolation at 600 kHz.  That may be why someone has it set for much more loss.  However I think 6 db of loss is way out of line.  Maybe 2 to 2.5 db of loss would be the maximum I would set it for if I needed more isolation.
How are you tuning the duplexer for the pass ?  The best way would be a RLB , but you may be able to tune it for the least loss, then tune it for the best rejection.  Most of the time you have to tune the pass first and then the reject.  If very far out of tune you may have to retune it a second time .

Our duplexer is a Sinclair Q2330e VHF. When we first got it we were told that by rotating the loops we could adjust the insertion loss for times when you might need some extra attenuation or just best performance. Others told us no way but Sinclair confirmed this. But they tune using a network analyzer that I don't own or even know how to use. Any way, we have 6db of insertion loss that shouldn't be more than 1.4. I'm still learning this service monitor. I was able to tune the pass and reject. Can someone suggest how to test the insertion loss? I was thinking (dangerous) that if I use the monitor to generate an on frequency signal and then loop back to the spectrum analyzer and watch the change of the spike. Yes? I am a rookie and don't know quite what to ask.

Thank you.

Tomas Guerrero

Hi Clif,
The question was for Tomas, but hopping frequencies is easy, just store the set-ups and they are just a couple of button pushes away.

That is a good idea for him.  There are 2 quick ways I use.  One is just the Previous button to switch back and forth from one setup to the one before it.  The other is to store several most used setups in the memory.  Sure saves lots of time if doing something very often.
I also like the Power On function so the set will come up in my most used setup.

You can see it all at once if you expand the span but the accuracy suffers.

Hi,

I've just noticed this in my 8920A and I was lucky to find this thread. It was not a surprise since to put 0dBm out of the main RF IN/OUT the generator would need to output +14dBm to overcome the high power attenuator, which is always inline. I understand the inability to output all that power but the firmware could give a UNCAL warning easily since the presence of the attenuator is known to the instrument

Thanks Robert, again.

Best regards,
Roberto EB4EQA

Simple, when exceeding -8dBm mine tells you to go to the Duplex port and then goes on up to +16dBm, calibrated. You have to be careful though because the duplex port is not protected like the RF port.

Just checked the output levels on my 8935. At the Duplex Out port, the maximum output is +10 dBm. The level does not change in the setting range +11...+18 dBm.

At the RF Out port, the maximum output is -25 dBm. If the level is turned up beyond -25 dBm, the following warning is displayed, but the measured power output still tracks the level setting up to -18 dBm.

"Change RF Gen Amplitude, Output Port or Atten Hold (if on)."

The same warning is displayed if the level is turned down below -18 dBm with the Duplex Out port selected, but the measured power output still tracks the level setting down to -20 dBm. Below -20 dBm the level setting is essentially uncalibrated.

(Levels measured with HP 432A and 437B power meters).

73, Adam VA7OJ/AB4OJ.

On my 8920A from the RF port it tracks to -8dBm, within +/-0.5dBm Then switching to the Duplex port it tracks to +17dBm again +/-0.5dBm. Measurements were done on my HP 8594E Spectrum aAalyzer because I was too lazy to dig out the HP 435B Power Meter. I had previously checked the output on the Power Meter but didn't remember the exact numbers. SA close enough for now.

I would say it depends on the impedance of the filter.  If the in and out of the filter is 50 ohms, then just coax.  If some other value you would need to find something to match the impedance of the in and out of the filter.

Hello:
I have an Agilent 8935 series E6380 Test Set (CDMA Base station Test Set)
It seems to work well.
In order to use the RF tools.....
I think I need a return loss bridge, resistive splitter, open and short loads and 6 db attenuator x 2.
Maybe a few short coax leads with N connectors

I plan on using these in HF and possibly VHF to measure coax and antennae.
.

Any way, I think this is what I need to use the RF tools program in the unit. Am I correct?
Any suggestions?
Are the Minicircuit and Chinese return loss bridges any good?

Wally KC9INK

RF tools is not necessary. I have it, but never use it.

I recommend the Amtronix RLB. http://www.amtronix.com/rlb.htm

I don't know about the ones from China.  I am using a Minicircuits ZFDC 20-5.  For general test work it is fine.  Might not hold up to the lab standards as the more expensive ones, but for tuning  duplexers and other service type work it compares well to the RLBs that cost several times as much.  You probably do not need the shorted and open loads unless doing lab work.  Just leave the port open when calibrating.  I don't see enough difference when using the attenuators or not for general work on my 8924C so seldom use them.
YOu need the RLB  for most of the work with the RFtools, and the resistive splitter for some of it.I think the resistive splitter is mainly used to find bad places in a length of coax.

Hello:I have an Agilent 8935 series E6380 Test Set (CDMA Base station Test Set)It seems to work well.In order to use the RF tools.....I think I need a return loss bridge, resistive splitter, open and short loads and 6 db attenuator x 2.Maybe a few short coax leads with N connectors
I plan on using these in HF and possibly VHF to measure coax and antennae..
Any way, I think this is what I need to use the RF tools program in the unit. Am I correct?Any suggestions?Are the Minicircuit and Chinese return loss bridges any good?

You don't need RF tools for basic work, just the RLB. Infact the basic spectrum analyser / tracking generator set-up id better for adjutments as it responds in real time. What RF tools gives you in this area is automatic compensation for cables and RLB allowing precise measurements.
For low frequency wourk you can use a hybrid divder inplace of the RLB. If you get a 1-4 one (basically 3 1-2 ones cascaded), terminate the two middle outputs and use the remaining ones you will get better directivity. You can also make your own RLBs. If you are happy with one for HF and anothr for VHF they are easy to make, Trying to cover 100kHz to 18GHz in one unit is harder :-) do a google search

Robert G8RPI.

Hi Wally,

You can use Mini-Circuits components with confidence. I use a ZFRSC-2050-N+ resistive splitter and a ZFDC-20-5-N+ directional coupler (both with N fittings). The coupler makes a decent return loss bridge.

Amtronix offers a good return loss bridge:

http://www.amtronix.com/rlb.htm

As for the Chinese stuff…not familiar with it.

# 2481. Generating a RF tone at x dB or level

Yahoo group: hp8924
Date: 2016-10-18 14:05:06 UTC
From: tomasguerro@...
Topic: 2481  Message: 2481

I have numerous Vertex radios that I've tuned with an IFR. Easy. Generate a signal a believe at -20. But now I have a 8924 and a Motorola MTS2000 and a XTS 3000 that are not quite on it compared to a Yaesu HT. The display on the 8924 looks different. Can someone refer me to the manual page on the 8920 (or 8924c) that will, help me? Am I adjusting the REF LVL of the 8924? -20dBm seems awfully hot to be tuning the RX on any radio. I have never used the Astro Spectra or Astro 25 Tuner software but have both. I own a couple of Astro Spectra P25 VHF that need to be recapped and tuned. I love ( ◔_◔ ) learning new software challenged by a different service monitor. I'll admit that I am not a heavy weight on the 8924. Still plugging along learning as I need. I don't mind Googling but to do that you often need to know the phrase needed to find what you want.

# 2482. Re: [hp8924] Generating a RF tone at x dB or level

From: Ralph Mowery
Topic: 2481  Message: 2482

Are you confusing the Japanese way of measuring the signals ?  Seems that they use a method where their 20 db is really around 5 uV in the way most of the US signal generators are set up for.  I would think the receivers would be set up for more like -100 dbm or less.
The 8924c has a place in the configuration menu to set it for an open circuit or 50 ohm output.  Most likely you should set it for the 50 ohm setting.  There will be a 6 db of error if set to the wrong one.
By pressing the RX test button on the front of the 892 you should get up a screen where on the left side you can set the output.  It may be in any of several forms.  Then go to the keyboard and look for the form you want , dbm , uv mv or whatever.
Page 83 of the 8920a,b Applications manual will show the screen.
As you should know, the 8924c manual is just about worthless for anything but the cell phones and you need to look at the 8920 manuals and try to convert what they say over to the way the 8924 is laid out.

You're right - the Japanese instructions call to inject a 20dB signal and i agree that it should be closer to -107dBmn, which I've learned is the reference for many tests on performance. I don't know if the 8924c is set for 50 ohms although I set POWERON. I assumed. Our duplexer is showing a loss through it of 6dB and now I wonder if it is actually tuned correctly after all. It does seem that I want to generate a weak signal for doing electronic tuning. I've never used Astro Tuner and don't want to screw things up. I can't find an online document on using it. Gotta love On the job training :-) I don't use the 8924c manual :-0

# 2484. Re: [hp8924] Generating a RF tone at x dB or level

Topic: 2481  Message: 2484

To check the 50 ohm setting:
Press blue SHIFT keyPress Test (above it will be a blue Config)
On the lower left of the CRT will be a RFGen Volts.  For a 50 ohm output impedance  put the underline under 50 ohm.  For an open circuit voltage situation set it to the other.
 This usually changes the calibration by 6 db (I think).  Never used it that way.
More to the right of the CRT is RF Level offset.  Set it to 0.0 dbThe ones below it should also be set to 0 db.  That is unless you know of some other reason.  One is that if someone changes an internal dummy load attenuator without updating the calibration software, or you always use an external atteunator and are compensating for it.
The output and input port can be set for whatever you want.
You may have seen the amtronix.com website.  They have some screen shots on it.  Also the e8285 is very similar to them as well.
http://www.amtronix.com/hp8924c60.htm

Those monitors do so much it can take months to learn how to get the most out of them.
The 6 db does seem like a lot for a duplexer to have.  I have a 6 cavity ( s on each side) duplexer that at a 600 khz split on 144 mhz looses about 3 db, but it is suppose to because it has the high selectivity option on it.
I don't know anything about an Astro Tuner either.

Thank you Ralph. We bought the SM from Amtronix and have all of his documents. I've learned that there are several ways to do the same thing. I'll check the 50 ohm / 0.0dB. I assumed that it was set. Our duplexer has adjustable insertion loss and we assumed that someone rotated the loops. I don't own a network analyzer that shows the notch/pass/insertion loss all at one time. So... I have to do it the old fashioned way -- take it too a local two-way shop! All I work on at this point are 50 ohm radios, so that's what I'll set I/O for. I've searched all day for the Astro 25 manual with out success. I'll have to use the help screens. I expect that it will tell me to inject a tone at N level and then click READ. It will change the RSSI. Just like Vertex.

Thank you!!!!!

If you are planning on taking the duplexer to the two way shop, you should give it a try at tuning it with the 8924.  Duplexers have been tuned without the NAs for years.  I have tuned and played with the loops on several of them and the duplexers seem to work fine.  I am sure lots on here have also.

What kind of duplexer do you have ?
You should be able to check each cavity to see how much loss you have in each one.  There are some videos on youtube that show how to tune the duplexers.  I think many of them use the e8285 which is very similar to the 8924.
If yo do not have a return loss bridge, you should get one.  There is one made by Minicircuits that works very well for under $ 100.  I bought 2 off ebay a while back.  Gave one to a friend that need one.  Attached is the info on it.
Here is one of the youtube videos.

Thank you Ralph. We bought the SM from Amtronix and have all of his documents. I've learned that there are several ways to do the same thing. I'll check the 50 ohm / 0.0dB. I assumed that it was set. Our duplexer has adjustable insertion loss and we assumed that someone rotated the loops. I don't own a network analyzer that shows the notch/pass/insertion loss all at one time. So... I have to do it the old fashioned way -- take it too a local two-way shop! All I work on at this point are 50 ohm radios, so that's what I'll set I/O for. I've searched all day for the Astro 25 manual with out success. I'll have to use the help screens. I expect that it will tell me to inject a tone at N level and then click READ. It will change the RSSI. Just like Vertex.

Thank you!!!!!

Hi,Note that the RF Gen Volts setting does not actually change the output impedance, just the indicated level versus the terminal voltage. Its related to the old "Hard" and "soft" volts. Old signal generators used to have a low impedance output set to a level with a voltmeter (no levelling) and then used a series 50 Ohm resistor. If you terminate this with another 50 Ohm load (Rx input) the voltage at the load dropped by half (power by 6db as stated by Ralph) These were "soft" volts. Later generators had proper levelled 50 Ohm outputs and the out voltage remained the same terminated or otherwise - "Hard" volts. back in the day you had to know if the test spec was for "hard" or "soft" and adjust accordingly. Most people use dBm these days so it's not a common problem.

Subject: Re: [hp8924] Generating a RF tone at x dB or level

To check the 50 ohm setting:
Press blue SHIFT keyPress Test (above it will be a blue Config)
On the lower left of the CRT will be a RFGen Volts. For a 50 ohm output impedance put the underline under 50 ohm. For an open circuit voltage situation set it to the other. This usually changes the calibration by 6 db (I think). Never used it that way.
More to the right of the CRT is RF Level offset. Set it to 0.0 dbThe ones below it should also be set to 0 db. That is unless you know of some other reason. One is that if someone changes an internal dummy load attenuator without updating the calibration software, or you always use an external atteunator and are compensating for it.
The output and input port can be set for whatever you want.
You may have seen the amtronix.com website. They have some screen shots on it. Also the e8285 is very similar to them as well.
http://www.amtronix.com/hp8924c60.htm

Those monitors do so much it can take months to learn how to get the most out of them.
The 6 db does seem like a lot for a duplexer to have. I have a 6 cavity ( s on each side) duplexer that at a 600 khz split on 144 mhz looses about 3 db, but it is suppose to because it has the high selectivity option on it.
I don't know anything about an Astro Tuner either.

You're right - the Japanese instructions call to inject a 20dB signal and i agree that it should be closer to -107dBmn, which I've learned is the reference for many tests on performance. I don't know if the 8924c is set for 50 ohms although I set POWERON. I assumed. Our duplexer is showing a loss through it of 6dB and now I wonder if it is actually tuned correctly after all. It does seem that I want to generate a weak signal for

doing electronic tuning. I've never used Astro Tuner and don't want to screw things up. I can't find an online document on using it. Gotta love On the job training :-) I don't use the 8924c manual :-0

We do have the RLB - got it when we got the 8924c but haven't needed it yet. I have the special tuning instructions for the Res-Loc Q series.

I know that the duplexer can be tuned with a tracking generator and of course we have that with a 100 watt load limit. But the Sinclair Res-Loc Q2330e is considered a premier duplexer and a SOB to tune without a NA. I'm willing to try but I'm still new at just a BrBp.

To do it with the 8924 I'm told that I have to neutralize the cables so that they don't act as part of the circuit. Or is it Normalize? You get me. Then tune the pass with the INVAR rod and the notch with the capacitor. The insertion loss is tuned by rotating the loops one by one. Should be no more than a I/L of 1.4dB. I live out in the middle of nowhere and don't have hands on help teaching me.

https://youtu.be/U7QZzzB2LZU https://youtu.be/U7QZzzB2LZU

As an alternative I have WaCom WP-642 6-pack 4"-8" cans. Both are rated at 350 watts ffor specifications.

Hi,The 8924 in TG / SA mode IS a network analyser :-) It does not give phase information (its a scalar NA not a vector) but you don't need that for tuning a diplexer or amplifier. You do not need to normalise the system to make adjustments. You only normalise for accurate measurements. The RF tools software allows normalisation but it only does a single sweep so no use for adjusting. You set the frequency without the RLB and then use the RLB for input and output match adjustment if required.

The Japanese DB at 0 dB is equivalent to .5uv into a 50 ohm load or
-113dBm.

+60dB is 500uV and -53 dBm.

6dB difference is correct between open and 50 ohm impedance.
The plus 20 they referenced is actually 5 uV. A good alignment voltage
for FM work.

Some older receivers, like Motorola Micor and MX300, had tuneable helical filters in the front end. If you were retuning these radios "from scratch", you needed a significantly stronger signal to get through the untuned filter. Once you began tuning, you would reduce the signal in steps so that the peak response of the tuning coils was evident.

OKAY. I think I am taking us into the weeds and overly complicating this. I am new to repeaters. I can setup a Motorola MSF 5000, a TKR-750, a RC-210 and even a GR500 (LOL). BUT -- I cannot tune the damn duplexer. I don't know how to tune the insertion loss for the lowest. We are using a Sinclair Q2330e Res-Loc rectangular duplexer rated at 1.4dB maximum insertion loss (I/L). We have a 6dB I/L. I have spoken directly with Sinclair's lead support representative and told how to tune the device using a NA. We have a HP 8924c and don't know how to use it as a NA. The video attached shows Sinclair easily tuning the BrBp and the I/L all at one time using a NA. Soooo easy! How do I setup a 8924c a a NA? Sinclair tells me not to use a RLB, which I own from Amtronix. I have used it to tune a single cavity.

Incidentally, they want $200 US to "inspect the unit", and then parts and labor that is unstated. PLUS shipping in both directions. That is just ridiculous.

https://youtu.be/U7QZzzB2LZU https://youtu.be/U7QZzzB2LZU

Should I just switch to our WaCom WP-642? It is 6 cavities that are 4" radius and terminate in UHF connectors which I am not fond of. I prefer N. One tunes the pass with the INVAR rods and the 642 has trombone like tubes on the sides that tune the reject. No mention of tuning insertion loss but the loops do seem tuneable as well. That's what this is all about.

Sorry. I am so frustrated at this point because my elmer moved away and no one has stepped forward to help. I live in the middle of nowhere and I'd even drive to them. But...

Topic: 2481  Message: 2493

Tom I think you are making it more than it really is to tune the duplexers.  As you are new to this, it seems complicated, but not really.  Take the Wacom and play with it some to get the hang of things.  The Wacom is not adjustable for the loss by the end user without great difficulty.  The loops do not rotate.
Start with each individual cavity and adjust them.  Do the pass (return loss) adjustment first and finish with the notch.
Look at what I put together a while back to show someone else about setting the Wacom and 8924 up.
Look at the number on the videos so you do not get them out of sequence.https://drive.google.com/drive/folders/0B7wJcih38lRAWHJDa3U5MklBRFU

Let me know if this helps.
As I mentioned if you want to talk about this, I can meet you on any of the low bands.

OKAY. I think I am taking us into the weeds and overly complicating this. I am new to repeaters. I can setup a Motorola MSF 5000, a TKR-750, a RC-210 and even a GR500 (LOL). BUT -- I cannot tune the damn duplexer. I don't know how to tune the insertion loss for the

lowest. We are using a Sinclair Q2330e Res-Loc rectangular duplexer rated at 1.4dB maximum insertion loss (I/L). We have a 6dB I/L. I have spoken directly with Sinclair's lead support representative and told how to tune the device using a NA. We have a HP 8924c and don't know how to use it as a NA. The video attached shows Sinclair easily tuning the BrBp and the I/L all at one time using a NA. Soooo easy! How do I setup a 8924c a a NA? Sinclair tells me not to use a RLB, which I own from Amtronix. I have used it to tune a single cavity.

Incidentally, they want $200 US to "inspect the unit", and then parts and labor that is unstated. PLUS shipping in both directions. That is just ridiculous.

https://youtu.be/U7QZzzB2LZU

Should I just switch to our WaCom WP-642? It is 6 cavities that are 4" radius and terminate in UHF connectors which I am not fond of. I prefer N. One tunes the pass with the INVAR rods and the 642 has trombone like tubes on the sides that tune the reject. No mention of tuning insertion loss but the loops do seem tuneable as well. That's what this is all about.

Sorry. I am so frustrated at this point because my elmer moved away and no one has stepped forward to help. I live in the middle of nowhere and I'd even drive to them. But...

# 2494. E8285A replacement options for HF work only?

Yahoo group: hp8924
Date: 2016-10-26 20:24:46 UTC
From: Frank Hughes
Topic: 2494 Message: 2494

Hi,The HP E8285A I bought from Amtronix many years ago is no longer working.Fans come on but display remains dark. Might have paid $600 for it, no complaints,amazed the ancient thing lasted this long.
Are any of the boards and/or display compatible with the more recent Agilent E8285A?
Last year an Agilent E8285A w/ OPT 102 came up for sale locally, $400, appeared as if it was never installed.Obtained all the SW & HW from Chris Day, ZL1CVD, to modify the unit to operate at HF, great!
So before I put the old HP E8285A in the cage with the dead parrot, thought I would see if any parts can be salvaged.
I know the Agilent unit won't last long either, already had to replace the AC input filter (stinky!!!).
Thus, would appreciate any suggestions for another SA w/TG for HF work only.73FrankKJ4OLL

As Robert said the two units are the same.  YOu could probably swap modules and see which one is giving the problem.
YOu did not state the price range you were looking to be in.
  I know a fellow that may still have an IFR 1200s with the tracking generator for about $ 2200 shipped , but it is still going to be in the same age bracket as the unit you  have.

Yes, Rigol is really good, but does not replace full-featured test set. Have both DSA815TG and HP8920A in my workshop, and both used on a a regular basis.

Even SA/TG in Agilent service monitor used time to time, because Rigol cannot sweep with offset.

Yuri, can you describe this more, what is the offset you need, and how is it used?

I meant TG operation at a specified offset from current SA freq. For example, SA displaying 144-146 MHz and TG sweeping synchronously in 14-16 MHz range (130 MHz below SA).

Last time it was final tuning of TX part of Javornik II 144/14 MHz transverter with all lids closed in attempt to get as flat as possible TX power in whole band, from EME subband at the bottom to satellite portion near the top. 8-)

Can you tell me about the AC Input filter, part number etc. I have an HP8920B and it was like new when I bought it some 12 years ago. Seldom used, usually unplugged, but whenever first turned on it has that smell. Is it a capacitor failing? Epoxy uncured? What is it exactly and will it damage anything?

"So before I put the old HP E8285A in the cage with the dead parrot, thought I would see if any parts can be salvaged.
I know the Agilent unit won't last long either, already had to replace the AC input filter (stinky!!!)."

the 8920's that start to smell when turned on are usually the power supply needing to be re-capped. The power supply was unique to the 8920/21 model and not leveraged in any other product.

The AC input filter failing is a new one to me ...all these years and never replaced one due to an electrical failure

You can go to the TX test screen.  Curser up to the top options where it says TX Power.  To the right it will probably have a W in the highlighted area.  You can set it to W, DBM, V,MV,  DBuV.
With about 5 decimal places of wattage I doubt you will get any lower power readings on any of the scales.  If you get below about 100 milliwatts you will probably have to go to the spectrum analizer and the antenna input.  Just do not hit that port with more than 200 milliwatts.
When you get the Power set to the units you want, go to the lower options to the TX PWR Zero and  push in on the round knob to zero out anything that may be showing up in the power scale.

It is easy to remove the power supply.  Just what seems like about 100 screws to remove to get to it, then I think there are 2 plugs on it with about 10 wires each.
While it won't tell you much, look in the back of the unit and see if you can see a green LED glowing.  It will be on the right side when you are looking at it from the back.
Amtronix sells the supplies for around $ 200 and you get some back when you send them the old one.http://www.amtronix.com/

Do not run the 8924 with the cover for very long as it will overheat.

My 8924C sits on my bench, plugged in but rarely turned on. The other day I decided to use it for a minute but when I hit the switch, nothing. So, I have an unused 8924E model. Can I just swap the power supplies? I understand that power supply removal is no simple matter. Maybe I can repair the supply and put it back in the Ë"model. I have read threads in the past detailing power supply repairs. I have my fingers crossed.

Finally got around to removing it from the bench. The little green LED isn't on. I thought it had an accessible fuse, but I don't see one.

I removed the supply. The fuse is good and there are no bulging caps. Pluging it in outside of the analyzer seems of little use since the on/off switch is in the analyzer itself. Guess the next step is to haul the organ donor up and make sure it powers up. I have repaired lots of linear supplies in my day, but switchers, not so much. I might look to Amtronix for a rebuilt one.

If you don't at least try to fix the supply you have,  you're wasting money. There is much information on this group about how to fix these power supplies.  For less than $10 you can replace a couple of capacitors and have it running again 9 times out of 10.  It's far from being rocket surgery.

Ahh, it didnt quote the message, this would be the file:

File : /GBS8220 to HP 89xx.rar
Uploaded by : leonnix77 <leonnix77@... mailto:leonnix77@...>
Description : This LM1881 interface for the GBS8220 worked for me - schematic included. Many snippets of information in separate places but never could find a complete schematic. Hopefully it will help others. Again this worked for me, no guarantees it will work for others.

You can access this file at the URL:
https://groups.yahoo.com/neo/groups/hp8924/files/GBS8220%20to%20HP%2089xx.rar
https://groups.yahoo.com/neo/groups/hp8924/files/GBS8220%20to%20HP%2089xx.rar

Its apparently deleted. I was rebuilding the sync converter for mine, i think there may be a problem with the GBS-8220 itself at this point so im likely going to just buy another and see if thats why im no longer getting video out of the converter on any of the inputs other than the YGB input and only directly from the 8924 and nothing from the sync circuit when its connected to said input. I think while it was in storage static may have killed both lol.

Thanks for pointing out the message hadnt been quoted!

David

# 2520. 8924C 10 MHz Reference Osc Failure

Yahoo group: hp8924
Date: 2017-01-06 12:45:27 UTC
From: black@...
Topic: 2520  Message: 2520

Information learned when my oscillator failed that may be useful to others.

Symptoms - After boot-up there were periodic beeps and an unlock message at the top of the screen. The initial 5-10 minutes duration slowly increased to over an hour in about 2 years of occasional use then became permanent. Instability very obvious in rx and tx modes when out of lock as warbling tone. After repair there are no beeps or error messages after boot-up. I'd always had some error messages and beeps when 'cold starting' but after the repair and talking to another 8924 user there should be no reference error messages after boot-up unless possibly very cold at turn-on. If you have the same symptoms read-on.

Repair - While waiting for a replacement oscillator I thought I might as well try repairing the faulty one. Just too inconvenient to not have it available as well as what to do with a partially dismantled 8924 for a couple of weeks? The oscillator is attached to the rear panel with 3 bolts and can be removed with the rear module cover in place by disconnecting the coax plug and un-soldering the 4 wires as you lift it out. I understand there is a connector on the end of the 4 wires but it appears very difficult to reach. Recommend extending the wires by 50 mm to make reconnecting easier. Remove external power before starting as there is an un-switched 15 V standby rail going to the oscillator.

I cut the metal cover open where it is soldered to the mounting flange carefully with a hacksaw. This gave access to the pcb after lifting out some insulating foam. After some time spent checking voltages I suspected the LM358 had failed and replaced it with a MC1458 I had on-hand. The oscillator now had output and the heating was working again as well. Re-soldered the cover back in place, refitted and reassembled, checking it still worked after each step.

Learnt - Once the oscillator's case is breached with the right mix of skill and luck the prospects of being able to repair it are OK.It has mostly common SMD components with recognizable markings but keep in mind temperature characteristics. The crystal's temperature marking is 83.5 deg C. There is not much thermal mass in the oscillator allowing it to quickly reach operating temperature. On the oscillator I have the 15 V standby supply connected to the heater transistor but does nothing unless the main power supply is operating. So there is no point leaving power applied to this 8924 when not in use. Other makes of oscillator might have different internals and maintain operating temperature in standby. You may be able to tell if yours is the same by checking for any warmth on the back panel next to the adjustment screw after being in standby for a time.

Next - In 2-3 weeks I hope to have received the replacement oscillator and a GPS disciplined oscillator (GDO) to evaluate the repaired unit then decide whether to stay with the repaired unit, fit the replacement or use the GDO as the 8924's reference full time. Also to work out roughly how long it takes after a 'cold start' to reach stability. Useful to know/justify how much time to take over lunch.

I replaced the two caps on the small daughter board. The caps I had on hand were lots bigger than the originals. Got the supply back together, put it back in the analyzer without any screws and it works again. Thanks to those who posted for the encouragement. Now, I have to figure which of the hundred screws I have left goes where.

I had great success converting my HP 8753C Network Analyzer video to VGA using the much-less-expensive GBS-8220. It's typically in the $30.00 range.

You might want to give it a try.

I did not need a sync stripper.

The sync was on the green signal, so I connected the green signal to the green input, and also through a 1K resistor to the sync input.

Works like a charm!

I did not need a sync stripper.

The sync was on the green signal, so I connected the green signal to the green input, and also through a 1K resistor to the sync input.

Works like a charm!

I had great success converting my HP 8753C Network Analyzer video to VGA using the much-less-expensive GBS-8220.  It's typically in the $30.00 range.

You might want to give it a try.

I have an Agilent E8285A that the CRT has died. Is the external video connection on the rear supplied from the same module that drives the on-board display? Would it be possible to go with an external monitor to get another 10 months or so of use. I have already planned for a replacement service monitor but can't purchase until after the first of the year. Any suggestions are appreciated.

Thanks for the help
Tim

I doubt that the VGA output is from the same module. You may need a graphics converter though. Have your display module checked first.

The display driver E6380-61816 inside E8285A drives both the plasma display and the rear panel composite video out. A common no-display failure is dry caps on the back of the plasma display. I have yet to see the display driver card (E6380-61816) fail! Search these messages for GBS8220 converter. Also there is some stuff in the files section. Have a hunt, its all here...

I see that Amtronix notes that the E8285A and 8935 have 15 kHz scan rate while the 8924x and 8920x have a 19 kHz scan rate on the video output. The 15 kHz rate seems to have many more options for converters than the 19kHz rate.

Maybe that's the confusion over why some solutions work for some and not others. I think I will order a 15 kHz converter of some sort for my E8285A and see how it plays. And see if I can get by without a sync separator and just use a resistive splitting network to supply sync to the converter.

Am I way off base or does this sound about right for those that have done an external monitor specifically on the E8285A.

Half the fun is making it work, right?

Hi that sounds about right. If you don't mind having a play the "bare" GBS8200 /8220 boards are a lot cheaper than a packaged solution.As noted this unit uses a plasma display not a CRT. Unless it's a simple capacitor failure or similar I'd look at replacing it with a small LCD of the type sold for car use and a GBS8220 (use the second output for external display) fitted internally.The plasma displays are very expensive to buy or repair. I've seen test equipment (mostly telecom) scrapped just to get the display. If you do swap it out one of the companies that repairs plasma displays will almost certainly buy the faulty one from you for spare parts.

Hi Tim..
I have also been looking for an external display option as my E8285A has some screen burn. I have looked thru the archives and have seen some references to various ways to get some of the service monitors to work on an external monitor with varying levels of solution complexity.
Has anyone used an external display on an E8285A with a currently available specific board from a specific vendor?  When you go look at available boards there are many options and clones out there.  It's a bit overwhelming to try to pick one that will work.
Along similar lines....does anyone if a solution for say an 8924 would work for the E8285A? I would think  the the old spec video output is the same on a bunch of HP equipment.

Guys just wanted you all to know, if its an hp device, with a composite video out that there is a easy option for connecting external monitors, TV etc..
I have a Sony DSC-1024G, it is a video signal editor basically, it does allow you to use a 15khz HP video signal and it will convert it to whatever you want, I love it but be aware mine gets a little warm so don't stack a lot of stuff on top, preferably just a LCD monitor. these units run approx 50 - 125$ used right now, I got mine for 50. there were 3 on eBay 50,125,135 so if you look around you may be able to find one cheap. the only other option is you can look in the file archives and modify one of the video game boards to do it but i haven't been able to make it work yet.
I also found a guy that has brand new CRTs for these units, the 8920's and the 8924's cost of a brand new CRT is about 120, i went ahead and replaced mine as it had some screen burn, and i wanted to get it fixed before the parts became to hard to find. so i still have my old CRT as a backup in case something happens but not a bad issue. I turned the brightness all the way down, and if I want it lower there is a pot on the internal board for dimming it more. then I just use the external monitor.

if you have the gbs8220 working could you please send pictures and schematics, the pictures and instructions in the archive are to vague for me to follow, and I have found no where else to get the modification notes. every once in a while I will need to haul the 8924 into the field, and its a but much to haul the Sony around too. I would like to get the GBS working for field use.

no immediate rush as my 8924 is down right now, the green LED at the back inside lights up but unit does not power up, unknown reason at this time. will check articles and post if I need help with that, but still would like to get GBS working.

Hi,
My GBS is tucked in behind the rack but I'll dig it out next time I'm in there.
I think I was probably the first to try the GBS on a 8924C. I use a LM1881 sync separator and the only issue I found was the need for a series resistor between the LM1881 sync output and the GBS as it does not like the 5V output of the LM1881. You can buy a boxed up ready to go units like the GBS8219 Xvga box but they are more expensive.

Robert G8RPI.

From: Ralph Mowery
Topic: 2536  Message: 2548
Attachments: 1 described; binary payloads are missing from this source WARC

This is the way I wired my 8200 .
To use the GSB-8200 converter with the hp-8924c service monitor.
Obtain:
LM1881N IC sync seperator.1 UF capacitor--2 required680 K  ohm resistor
To be mounted on the GSB8200 board will be 4 SMD 50 K ohm resistors.  Without the resistors the display will seem to work for about 30 seconds and fade out. That is what it did for me.
You will need to supply 5 volts DC for the gsb8200 and lm1881.
On the LM1881 connect pin 1 to the # 4 (gray wire) pin of the 8 pin RGBS input connector.Pin 2 to a .1 UF capacitor and then to  the Green input of the 8 pin RGBS connector A wire from that junction goes to the video input from the video output of the 8924C.Pin 4 to ground.Pin 6 has a .1 UF and 680 K resistor in parallel to ground.Pin 8 goes to 5 volts.Pins 3,5,7 are not used.
The 4 SMD 50 K ohm resistors are soldered across capacitors 29,32,33, and 36 on the GSB8200 board.  They are in a row between the 3 pots and an IC.
This will provide a green video output to a VGA monitor.

Just wanted to reply to this older thread.

IT WORKED!!!

seems I had this exact issue, the capacitor looked fine but it didnt work. I also had to use a 63volt that was larger and found I could mount it to the backside of the board easier as there isn't anything in the way.

So glad I joined this group, I would have never thought to check that circuit.saved me from buying another supply :)

# 2550. 8920 8924 E8285A replacement TFT display - realtek RTD2660 ??

Yahoo group: hp8924
Date: 2017-03-05 02:27:04 UTC
From: zl1cvd@...
Topic: 2550  Message: 2550

I see allot of people needing replacement screens for 8920, 8924 & E8285A. All these models have composite video out at HP's weird 15K or 19K sync rate = hard to find replacement. Many are using the GBS8200 or GBS8220 sync converts and TFT.

When you remove the crt from 892x or plasma from E8285A & 8935, these is enough room to mount a 5.6" ~ 7.0" TFT display.

I found Chinese chipset manufacturer RealTek makes a very common flat panel display controller IC RTD2660. This chip is field programmable to suit a wide range of TFT screen sizes and a brief check of the datasheet suggests it could be programmed to work directly with these (and other) HP's.

The problem is, you need a RTD2660 specific programmer and a good understanding of the chip registers.

What we need is someone who is familiar with RTD2660 to help out and perhaps program a bunch of standard TFT controller boards for the group. Example board is eBay item 152422170675.

Nice idea,
you can get a board with a 2660 on ebay from ebay or Adafruit
https://learn.adafruit.com/hdmi-uberguide/rtd2660-hdmi-vga-ntsc-pal-driver-board
https://learn.adafruit.com/hdmi-uberguide/rtd2660-hdmi-vga-ntsc-pal-driver-board
a progrmmer here
https://github.com/ghent360/RTD-2660-Programmer
https://github.com/ghent360/RTD-2660-Programmer
and assuming you already know 8051 programming and have a complier or whatever your personal choice is, and underatand video formats you just have to read the 400 page data sheet
http://aitendo3.sakura.ne.jp/aitendo_data/product_img/lcd_controller/Xs/RTD2660.jsp.pdf
http://aitendo3.sakura.ne.jp/aitendo_data/product_img/lcd_controller/Xs/RTD2660.jsp.pdf
and knock up a few lines of code
Simples

Not for me. My solution is a GBS8220 driving a small VGA display (in-car type from ebay, probably uses the RTD2660). Will all fit in the space from the monitor and the seconf VGA output can drive an external display.

Robert G8RPI.

Oh,
I should have said, if doing it internally you don't need a sync sepator as the signals can be tpped off the A20 display driver board.

I have an "XVGA Box" (Google search). It sells for abt $175-200. It is plug and play to an LCD monitor, I use an old 14" VGA one. Been running abt 3-4 yrs now. I needed a BNC T on the back of the service monitor and 2 BNC-BNC cables to the XVGA Box, a power supply and then plug in the VGA plug from the monitor.

Used on an HP 8920A

never mind, i figured it out, it was a bit confusing, i have the H7V settings on the monitor and the 8200, and i was adjusting the monitor. but its working now.

is there a way to fix the contrast so that the cursor shows up better like it does on the 8924, its hard to see as it blends in with the items in the menus.

I have tried the saturation,brightness and contrast on the 8200 and the screen. would love to have a histogram one to modify it but that's unlikely.

I think you are getting confused about the conversion as there are at least 2 ways of doing it.  One uses a different chip for the sync separation.  There is no pot in the  1881 sync separator conversion.  The only thing to be soldered on the board with the 1881 chip is the 4 resistors.  All other connections are made with the connectors on the board.  The parts I listed in another email are the only parts needed, not including a power supply.
I used a 12 volt wall cube going to the box I put it in.  Inside the box is one of the China bucking converters that converts the 12 volts from the wall cube to 5 volts.  That seemed to me as a simple way to get 5 volts from what I had at home.  The good thing about the China bucking converter is it is inexpensive, and acts similar to a transformer in that if you lower the output voltage, the current from the wall cube goes down.  That is if the wall cube is rated to put out 1 amp at 12 volts and you only need 5 volts , you can draw 2 amps or so at 5 volts and not overheat the wall cube. A 3 terminal regulator would require a wall cube of 2 amps for the same output voltage and current.
This is a pix of my conversion around the connector.  The red, yellow,and blue wires  are not used.  I just did not cut them off the connector.

H7V was not high voltage, its a typo, it was supposed to be H&V for horizontal and vertical.

its working fine now, i was just adjusting the monitors settings and not the 8200.

I would like to find a way to adjust the brightness of just the cursor. I also connected my blue wire to green so i could display in blue.

if you have any problems let me know ill show you my setup, incidentally it would be good to have a "pr py rgb" cable that should go to a vga connector, its not a true "component" cable but I made a very nice cable for the 1024 unit by cutting off the red and blue rca connectors , then cutting off green and replacing it with a bnc, so you end up with a bnc to vga, which your 1024 works best with the vga input. I can also help you change your settings on the 1024 if needed.

The Sony DSC-1024G seems like the way for me to go. Does the Sony just take it's feed from the rear connector on the HP E8285A or is there anything that the service monitor needs to be opened for? Another question is about the guy that sold new displays, one of the comments below says that the usual problem is with dried out or bad capacitors on the display unit. Would me buying a new display also replace these caps or is it just a basic display with no caps or other components on it? The reason I ask is that I've had several Strokes in the last 3years, these have just about wiped out my right side so I can no longer do a lot of the fine motor stuff. Thank you for your time and I hope I can return the favor some day soon.

great glad to hear it. my next project is to see if I can get my oscilloscope open and grab the signal off the monitor and route it to a external jack that I will try to find a place install. Its a HP 500Mhz digital storage scope with the older CRT. the CRT has a bit of screen burn, but I would love it if it has the same signal, as I could just put a A/B switch on the Composite lines to swap between them.

I have designed a new board to augment the GBS-8200, it has the sync separator on it, but also adds some simple red,green,blue adjustment knobs so you can define other colors, bright or dark. Green is ok, but it gets boring. Also it allows you to adjust the intensity so its not so blurry. also it fixes the output level of the 1881 so you can set the max output voltage of the new sync signal, Ive got mine set for 1.25 volts, I could go up to 3.3 but its working great.

Hi Tim,Both Rick @ Amtronix and Chris Day (another E8285A expert) told me that about 10%of the displays can be repaired, as they are not designed in a way that allows many of the electrolytic the caps to be replaced.I bought a used replacement from Rick (might have paid $250? can't remember).
But the Sony converter thing works so well, and costs so little, I am no longer concerned withthe remaining life in the original E8285A display. I'll use it until it goes dark, then switch to the PC SVGA monitor.73FrankKJ4OLL

its a Sony DSC-1024G, there is a PDF file in the Files section, you can google it or look at the pictures in the PDF.

there are 3 Flavors of the unit, 1024, 1024G, 1024HD all that's really different is the connections available on the back, the one that's in the PDF and that I have is the 1024G, the one Frank ordered is a HD. he might be willing to post some good clean pictures of the rear ports, I cant seem to find any good ones online. The G or the HD will work. The one without a G or HD, does not work with VGA to my understanding.

Topic: 2577  Message: 2577

It seems my power switch is not working correctly. Even with it in the off position the unit will randomly turn on and off. In the on position it works fine. Its my understanding that this is a reverse switch so in the off position the contacts are closed. If this is true then it seems that I may have dirty contacts? worn contacts? or perhaps there is a physical damage to the closed contact side?
I am not sure, I have not opened the case up and pulled the switch out to look at it. That's a project that I will have to disassemble the unit quite a bit I believe, and if I have to replace the switch, I don't want to leave it open while I wait for a part. So, does anyone have a reference or link to where I can order a replacement switch. Or has anyone else ran into this same issue? I don't wish to replace it with a switch that does not fit the original hole, and would prefer an original part. That is if I cannot fix this one.

# 2578. Connecting a VGA monitor to the internal video connector J6

Hi Everybody;

I want to extend the internal video to an external VGA monitor. I have checked the inputs of the VGA port on the monitor and they require Video, Hsync and Vsync which is provided by this plug usually for the internal monitor.
When I look at the signals on an oscilloscope the signals look good, but when I connect it to a VGA monitor the message that I get is "Input out of Range 19.2kHz".

Does anyone have any ideas why this is not working and how to solve this?

Any reply would be appreciated;

Alex

From: Robert Atkinson
Topic: 2578  Message: 2579

Hi Alex,This is because the HP video uses  a non-standard 19.2kHz line frequency. Standard VGA is 31.469 kHz. Addtionally you should not extend the internal signals as they are not designed to drive long cables or two loads.The established method is to connect to the external video connector and use a video converter such as the GBS8200 designs or Sony converter. Plenty of threads in the group on these.
Robert G8RPI.

Hi Robert and Everyone;

Thank you very much for getting back to me and indeed a lot of work has been done to get the incompatible video output converted to VGA.
I also see that a lot of people struggle with getting the video display stable and they use a LM1881 to extract the HSync and the Vsync signal. Both signals are are available internally and are produced by the video CRT drive assembly. There is no need for the additional LM1881 chip (see attached image)
If anyone wants to replace the CRT with a LCD it looks like the GBS8200 is the way to go, but the addition of the LM1881 makes the conversion cumbersome. I can understand that someone is hesitant to open the lid to get the signals needed for the conversion but the price of the GBS is $22 versus some other units that cost the $200 +.

I will keep you posted on the progress on the conversion of my HP 8921.

Thanks again and have a great day;

Alex

Hi Everybody;

Another thing that I forgot:
IntHigh, IntW and IntLow represents a simulated trimmer that changes values according to the brightness setting in the HP software.
If you have a LCB display that has a contrast pot you can remove the pot and connect the three signals accordingly and then control the contrast with the brightness setting in the HP setup.

All the best and thank you for this group;

Alex

A week ago I tried to power up my trusty HP 8924C, but no dice - dead. Following the "Repairing the 8924 Power Supply" I was able to "kick-start" the supply and confirm the problem (15V standby supply). So, I ordered up some caps from Mouser, replaced them, and it's alive again! Thanks!

While I was in there, I also replaced the main HV supply caps (1200uF/200V with 1500uF/200V) and the other cap on the daughter board (33uF/25V), both with 105C versions. I suspect the heat from the heat-sinked transistor helped in it's death... I also put the 47uF/50V in on the other side of the board to get it away from that heat source.

Just ran it thru a PCB_CAL, all passed...

Steve

# 2587. No output from about 250 to 260 MHz

Yahoo group: hp8924
Date: 2017-08-13 14:53:09 UTC
From: ku4pt@...
Topic: 2587  Message: 2587

I have a 8924c I bought for spare parts along with a working unit several years ago. The spare unit was missing the power supply. I obtained a rebuilt supply and the 8924c seems to be working fine except for one thing.

From about 250 to 260 MHz there is no output from the signal generator. It seems to check out ok otherwise.
Any idea what module or where to look for a failed output for such a narrow range of frequencies ?

I have verified this by doing a sweep using the spectrum analyzer and tracking generator in the unit plus looking at the output on another service monitor.

I started to swap a few modules from the other unit,but hate to undo those 'thousand' screws to get the case open.

Hi,I bit more detailed fault description would be useful.
Have you tried different output levels? Does the output drop instantly at a frequency or fade away?If it drops suddenly, exacly what frequencies does it stop and start working? Are they consistent?
Robert G8RPI.

Thanks for the reply Robert.
I tried many output levels and switching from the RF IN/OUT and Duplex out ports .  That does not make any difference.
At exectally 249 MHz on the screen the output is fine.  Go up one Hz and it instantly drops to no output.
On the high side about 272.826 it drops out all the way.  For about 100 kHZ  below  that looking at it with a IFR 1200S on the SA there starts to form a lot of spikes all over the screen which is 10 MHz wide on the IFR .
I attached a photo of the IFR screen set for a 1 MHz spread so you can see the spikes.  It does not do that on the 249 MHz frequency,but just drops to no output.
I checked and both audio generators are off so it should just be a pure carrier.  The set is set up to generate in the FM mode.
The 449 MHz plus 1 Hz is very consistent.  Hard to tell on the high end as it generates all those 'spikes' as seen  in the pix.

It's almost certainly the A-26 Board.

Try swapping that one.

Hi Ralph,The basic RF generatior in the 8924 is 500MHz to 1000MHz. The lower bands are obtained by division or mixing. For 250MHz to 500MHz the base frequency is divided by two. The mixing or division is carried out by the A26 output assembly. From your description of the fault it looks like the divideder is not operating at the bottom end. I'd supect faulty decoupling capacitor(s) on A26.
(from Assy level repair manual).This is basically the same design as the 8920B A13 Synth module. Looking t the 820 CLIP may give some clues. It uses a UPB584G

I'd suspect C103/C104 or U101 but you will have to trace out the identifiers for the A26 module.
HTH,Robert G8RPI.

Thanks Robert and WB4YJT.
I removed the 'thousand screws' and swapped the working A26 board with the one that did not fully work.  That seemed to solve the problem.
Now to find the components Robert listed.  I do have  a good stereo microscope and hot air rework station so I should be able to do the work.
I did run the internal diaganostics and it mentioned something about an input board, but that did not seem correct to me.  It was probably fooled as it takes a cable from the input to the output port to complete the connection.

The schematic of the 8924 A26 is the same as the 8920 A13 - which you can find in the Files section.

Look in the divide-by-two chain on the board.

Good luck!

Thanks, I think I have the files downloaded somewhere here.
I knew that much of the 8920 was like the 8924, but not sure what all is.  I did play around with a 8920 a friend had enough to see how it worked.  I have had an 8924c for 6 or 7 years.  A couple of years ago I got a chance to get another one that worked and one for parts.  The parts unit was missing the power supply.  I had swapped them for a test a while back and the parts unit seemed to work. It was just when I got a  power supply for it that I gave it a good going through and found the area around 460 MHz did not have any output.
I guess this will be a shotgun approach as it looks like it would take some extender cables to get the boards to where I could even try to test them.  Robert  gave me a couple of things to look at first.
I am not good with digital circuits, but can usually do RF and audio.

The divide-by-two circuit is the only digital element.

You could attach a wire to the input, and to the output, and check that the output signal is half the frequency of the input.

Or just replace it - it's the most likely suspect.

J.

Thanks, I tried that using a 200 MHz storage scope.  I never could get anything but a bunch of real junk looking stuff on the scope on either the in or out.  I did see the level change when I went to DC as I passed the low end near 249 MHz.
If  I can find one, I will get replace it and the capacitors Robert mentioned.  Most likely the IC will not cost enough to make an order.

I'd still check the decoupling capacitors first. It's unusual for a divider to be faulty at the low end but OK at the high. the smaller capacitor (470pf ? I don't have the CLIP to hand) by passes the unused side of the dividers differential input to ground. If it is low or  open circuit, stray capacitance may be enough at the higher end but not at the low.

Thanks, I put some on order.
Robert I also ordered some capacitors so I will probably replace them at the same time while I have everything apart and set up on the work bench.
I did run a couple of wires out from the IC and could not find a signal on the 200 MHz oscilloscope.  I think the reason is I was expecting  a 5 volt digital signal , but when I got a chance to look over the circuit I see it is a very low level analog signal.The scope probably would not see that low of level and the capacitance of the wires would probably really effect any signal that was there.  It may also not go high enough in frequency to see it.  Wish I had checked it with the working 8923c by looking at it with the SA before I unhooked the wires.
Really interesting as to how it can just affect a narrow band of signals over about a 20 MHz spread.

# 2600. Re: No output from about 250 to 260 MHz

Yahoo group: hp8924
Date: 2017-08-15 01:49:01 UTC
From: Clif Holland
Topic: 2587  Message: 2600

I haven't looked at the CLIP nor worked on one. But the description of what it's doing describes a PLL loop frequency/divide by step change (drop out at an exact freq) and then further up a picket fence which describes a PLL trying to lock and finally achieving lock at abt 260.

FWIW

Clif -

In this unit, there is a PLL that covers 500-1000 MHz.
The 250-500 MHz range is covered with a divide-by-two IC fed by the PLL.

Since the 500-1000 range is OK, the divider is suspected.

# 2602. HP8920B Auto Tune

Yahoo group: hp8924
Date: 2017-08-15 03:15:07 UTC
From: rhyolite@...
Topic: 2602  Message: 2602

I am using my 8920B in the RF Analyzer's auto tune mode for the first time and I have noticed it is selecting a frequency exactly 5 or 10 KHz below the actual operating frequency of the DUT.

The frequency measurement window seems right on (there is no issue of the test set being off frequency) and my measurements seem to be OK but it is disconcerting that when I look at the field it is in error so much. And it is always by an even 10 KHz. So I tried changing the increment values for the field and they seem to affect only manual dial entry.

Weirdly, I have just discovered that if I change to the Antenna IN instead of the RF/IN, the behavior is normal.

The way I am set up requires the RF/IN port so I can measure power as well as the deviation measurements, which there are 10 across 30 MHz band.

Doing this work manually will be a PITA.

I will add that when doing the actual test, I am modulating 1000 Hz or 20 Hz tones at just below maximum deviation.

When testing from the antenna, I am either modulating 12 Kbps CVSD at 80% system deviation or CTCSS tone at low level.

The test set is set for DC coupling , <20 Hz HPF and 99 KHz LPF to make these specific measurements.

I am not sure I am creating the same situation when using the Antenna IN, but, I do need auto-tune to settle on the carrier center when doing the 1000 and 20 Hz deviation tests.

# 2603. Re: No output from about 250 to 260 MHz

Yahoo group: hp8924
Date: 2017-08-15 03:27:29 UTC
From: rhyolite@...
Topic: 2587  Message: 2603

I have my test set programmed with a test that is basically a tracking mode that covers the entire band of the instrument and I plug jumper on when I turn the instrument on to see that the tracking is more or less flat.

I was initially concerned when I found dead spots at about 350 and 700 MHz when I next turned the instrument on. After some head scratching I read that the 8920B requires a 20 minute warm up.

Whenever it is turned on for a short time, just minutes, the VCO and PLL settle in and it is fine. It hasn't given me any trouble after a warm up. If your problem is at cold start, I would let it settle in.

It could be a VCO steering line voltage slightly out of spec.

Topic: 2587  Message: 2604

I have let it warm up for a long time, but no effect. I have 3 of the 8924c units now. Two work fine and do not need any warmup so to speak of. Takes about 3 to 5 minutes for the frequency to get close and that is all.. It is the 3 rd one that gives problems over just a narrow range from about 240 to 270 MHz.

The parts for the output module came in and I replaced them. That did not cure the problem.

I then switched the output modules from a working unit and the problem unit. The working unit stilled worked,but the problem unit still had the output problem, so I do not think it is in the output module.

I ran the RF diagnostic program and it does give one error.

**********
Counter with ECL devider

lower upper actual
250 249.990 250.010 271.780

Suspect Input Assemble (high)

**********

The unit receives fine in that and all other frequencies, but has no output in the range of 249 to 272.
Looking over things, it seems to me that something in the divider chain is not working,but no real idea.

I think I made a mistake the other day when swapping modules as some company came in while I was in the middle of testing and about the time I swapped the output module and ran a receive test, but not the output test.

I am thinking about swapping the input assembly but that looks like a major job to do. If I pull out the Input unit does anyone know what to look for ?

Thanks for the help.

That may be the case Robert.
I swapped out the signal generator board with  a working unit and it started putting out like it should and running the diagnostic screen shows all is ok where before it gave an error on the 250 mhz range.
I tried turning the VCO bias pot just for the fun of it and while looking at the SA screen with the in and out coupled together, the no output area started getting smaller.  After about 5 turns counter clockwise  (maybe I should say anticlockwise) it looked normal.
I am now feeding the signal into an IFR 1200s and it looks normal, but notice the FM deviation is only about 1.8 khz instead of 3 khz.  Will have to do some more testing later today as other duties call.
I am slowly learning a little about this thing.Only other time I have opened them up was to install a high power attenuatior  so I could run 60 to 100 watts into the unit.
Will have to do more testing later to see what is going on as the wife wants me to go off with her.  Says something if we don't get to the grocery store we will not eat..

Input module is a bit of a pig to get at. From a cursory glance at thread comments, I'd say there is something going wrong with filter B on input module. Either the filter itself or DAC controlling it. The input module for 8924 is very very similar to 8920. Somewhere in the group files is a CLIP for 8920. Have a hunt and see if a DAC is controlling a pin diode in the filter. I know the higher frequency filters use this method to tailor filter response.

Also, I can't remember if the 8924 has a service menu like E8285. If it does, you can go into the service menu option and manually adjust filter DAC output. What this will do is help you determine if it is a fault with the filter circuit or a calibration issue - DAC filter values are stored in calibration EEPROM.

If it is a hardware fault, its a good bet it'll be a faulty cap. They used 85DegC caps. Once dust builds up, they get hot inside and the caps dry out badly. I used to buy allot of 8924 & E8285 - fix em up and sell em on. But I got sick of replacing caps and have moved on to later gear.

Thanks for the reply.
I finally got some time to look the unit over with out any distractions.
After swapping the Signal Generator module with a known good one the 8924c started working correctly.  Passed the tests it failed to start with.  I then put the original module back in and started turning the VCO Bias pot and after about 5 turns the 8924c seemed to start working through the range like it should.  I ran all the internal tests and they all passed.
Maybe the Bias pot just needed adjusting ?  Could be some component changed value enough to throw it out of adjustment.

I then hooked it to an IFR 1200s and ran various tests in receive and generate modes.  They all seemed to work like they should.  I do not know the history of that set.  I bought a working one that checked out fine and this one that was labeled as a parts unit.  Not sure if it ever worked or not as it did not have a power supply at the time.  I just put in one and it got hung up with no output from around 250 to 270 MHz.
I know the 8924 and 8920 are vary similar.  I have downloaded the files several years ago.  Just never had to look at the internal workings of one before.  As with much equipment there are some know  weak spots and I though someone on here may  have seen that particular problem before.

# 2610. 8924c power supply

Yahoo group: hp8924
Date: 2017-08-18 19:02:13 UTC
From: ku4pt@...
Topic: 2610  Message: 2610

Wouldn't you know it.. Get one problem repaired and another starts up.

A power supply in a 8924c will not start up. The green light is on like it is suppose to be. Right now it will start up after leaving the 8924c plugged in for 5 to 10 minutes from not being plugged in for a while

I did replace the 2 capacitors on the vertical board that is mentioned in the files area but no joy. They tested ok on a China component tester after I removed them and the new ones tested ok. I also replaced 3 others on the main board that was mentioned. The C10 did check out at about half value, but it still will not start.

If you have not seen the component tester, it is similar to Peak tester that sells for much more and has several versions.

I did get as far as to measure the Stand by voltage and it shows 15 volts like I think it should, but drops to about 7 volts when the power switch is pressed.

Topic: 2610  Message: 2611

I got some time to look over the power supply. I remember a number of years ago some computers had the same problem with bad capacitors and found that heating them would sometimes get the computer started.

I laid the power supply on top of the 8924c wit the cover off. I then took the hot air gun from my hot air rework station as it has a small nozzle on it and started heating up individual capacitors. When I got one area hot the 8924c started up. By doing this several times after cutting the 8924c off and letting it cool down for an hour or so I was able to isolate an area.

I was the vertical board with 2 pots on it. I think is the one labeled J4. On it was 3 capacitors.

c11 4.7 mfd 50 V
c16 100 mfd 35 V
c17 33 mfo 25 V

Replacing them and now the 8924c starts up like it should even after being unplugged overnight.

I am going to test it for a while and then install those 'thousand' screws.

Did you mean ohm ?
Sorry could not find the horse shoe symbol.
Those capacitors are getting trickier all the time.  MFD, uF, then someone went pF and took away our uuF.  Lately they added the nF.  Were the condensers rated in  MFD ?
I checked and did put in the uF capacitors I had in hand, just like the ones that came out.  Lucked out and did not use any of my MF or MFD ones.  hihi.
I am getting old and the mind is going.  Often say cycles instead of Hz, 110 volts instead of 120 volts.  And the real good one of mickey micks instead of uuF.  Can I use 'puff' instead of pF ?
There must be a dozen ways to label the capacitors.  From numbers to all the color code schemes.
Just glad the resistors seem to be the same over the years.  Only the color code changed one time that I know of, not counting the SMD resistors, and percision resistors.  Went from body, end , dot to the rings.

If one capacitor has gone bad, others are right behind it.
Unless you really like the unreliability of the unit starting and really like dragging it onto the bench and removing all of those screws, I would replace all of the electrolytics unless you have very good reason to know that the others are not failing.
The cost of the capacitors is minimum as compared to the unexpected (in this case, expected) downtime.
All replacement capacitors should be 105 degree C or better and high current capable in the primary voltage converter.

After replacing all of the electrolytics, you should get many years of service from the supply.

When you repair a car engine, you do not replace the rings on the one cylinder that has lower compression, you rebuild the engine and replace all of the rings and gaskets.

Same here.

Did you mean ohm ?

Sorry could not find the horse shoe symbol.

Those capacitors are getting trickier all the time. MFD, uF, then someone went pF and took away our uuF. Lately they added the nF. Were the condensers rated in MFD ?

I checked and did put in the uF capacitors I had in hand, just like the ones that came out. Lucked out and did not use any of my MF or MFD ones. hihi.

I am getting old and the mind is going. Often say cycles instead of Hz, 110 volts instead of 120 volts. And the real good one of mickey micks instead of uuF. Can I use 'puff' instead of pF ?

There must be a dozen ways to label the capacitors. From numbers to all the color code schemes.

Just glad the resistors seem to be the same over the years. Only the color code changed one time that I know of, not counting the SMD resistors, and percision resistors. Went from body, end , dot to the rings.

I probably should have replaced all of them Glenn.
I did not have enough on hand to do that.
As This is just a hobby for me, and I now have 3 working units, I don't think I will have any down time.  I only have that many because I had one and got a chance to get another working plus parts unit for about $ 500.  I just added a power supply that was missing from the parts unit and it is now working.  I found that power supply for not too much.
I guess that I am a hoarder of equipment if I get it at a steal.  Like I bought a 8922 (think that is it) for $ 55 shipped.  Mainly because it uses the same display unit.. I thought it may have some more parts that would interchange if needed.  Too bad it was not the unit that had the SA in it.
If I was a shop and depended on them to make money,I probably would have replaced every capacitor.  I did check a few that were pulled out and changed before I found the problem and they were all good with a low ESR.
Like when I was working in a large company and a motor speed control for a 300 HP motor went bad.  A factory man came to repair it and found 2 diodes that were rated at a couple of hundred amps were bad.  As it was 3 phase and had one more, I told him to replace the 3 rd one.  He said they were about $ 200 each.  I told him that was not much as we could be loosing around $ 3000 per hour in production while the machine was down.

# 2617. E8285A V2.04 firmware

Yahoo group: hp8924

From: blaze_1024@...
Topic: 2617  Message: 2617

I'm wondering if anyone has the bin files for the E8285a v2.04 firmware. I have several 4mb PCMCIA ROM cards and the capability of writing to them which I've used successfully to write the RFtools bin files.

I know the files are available on Ebay but I simply can't afford it, About 5 months ago I suffered from 3 herniated disks in my back. I never knew it was posable to be in so much pain 24/7 my prescriptions alone are costing me over $1000 a month and I haven't worked in 5 months. To make matters worse they want to cut me open and grind away at my back bone with a damn Dremel tool.

Anyhow, I'm stuck in a wheel chair and losing my mind with boredom. My son set up my bench and shop so I can use it while in my wheelchair. I've had my e8285 for several years but due to work I never really got a chance to play with it. Anyhow It would be great therapy for me to learn how to operate it.

If you have the Bin files and don't want to post them on line you can email them to me, although I don't know why as the firmware for other models is available online..

I could also use the latest version of Memory Card explore as right now I'm using the Ricoh demo version which seems to work fine writing the old 4 meg CNC cards I have. But I am getting tired of having to reinstall windows on my old laptop every time I want to use it.

Best Regards
Dan Nelson

From: jyelmgren@...
Topic: 2618  Message: 2619

carefully 8} the plastic is usually old and dried out so it's lost a lot of the flexibility it once had and will break.

remove the RF I/O assembly first so you have some room to move the rod and work with. Easier to re-install with it out. You will have to remove three T15 ( I think ) screws , two Front Panel BNC nuts and a number of RF rigid cables ( exact number depends on the version and option ). The 9 pin D ribbon comes off as well once you get it flipped up.

Believe it just pushed on to the switch from the front. At least that is how I re-installed the last one a couple of weeks ago to re-install.

So going from memory.....

To remove the push rod put the power switch in the ON position so it's in all the way and you have room to push the rod forward,

Usually grabbed the exposed plastic of the on off SWITCH with a pair of small needle nose and used a smaller flat blade to lever the push rod UP and toward the front against the pliers.

If that doesn't go try to lever it "UP" or toward you assuming you have it laying on its top.

The switch plastic actuator snaps into a U channel in the end of the push rod which you may not be able to see very well.

Like I said this is from memory and not guaranteed to be completely accurate.

Be gentle and careful ...these are old and fragile most times.

# 2620. 8924C Signal Generator and Tracking Gen don't agree

Yahoo group: hp8924
Date: 2017-09-17 04:38:37 UTC
From: matt.ames7bc@...
Topic: 2620  Message: 2620

Hi all,

I was using my 8924C today, and just as a test of the unit itself, I ran a cable (three feet of LMR-400 UF) from the Duplex out port to the RF In/Out port.

For the first test, I used the RF Gen screen to generate a 10dBm signal, and then switched to the RF Analyzer screen to see what power levels the 8924 read. With 10dBm generated, the RF Analyzer measured 8.82 dBm which I thought was fair enough - there's a cable and two adaptors there so there's bound to be a bit of loss.

When I switch over to the tracking generator / spectrum analyzer, with 10 dBm on the tracking generator, I only see 7dBm on the spec an. The centre frequency is set to 430MHz on both tests. Am I doing something wrong, or is the spectrum analyzer out somehow?

The other thing I noticed, is that the RF Generator seems to be limited to no more than 10dBm - when I increase it past 10dBm up to the maximum of 18dBm, there's no change to the received signal power.

Cheers,
Matt

From: Ralph Mowery
Topic: 2620  Message: 2621

I noticed some similar things on my 8924c.  Try just setting the output to about 0 dbm max when using the tracking generator and SA.
The specs are only about 3 dbm for the duplex output and - 10 dbm for the RF output.  I think that if  you have a higher power than the 3 watt input that many of the 8924c's have you may even get less than the -10 dbm of the rf output.
For some reason the 8924c will let you enter more power out than it can generate.

# 2622. HP Formatted SRAM or Linear Flash card BIN file

Yahoo group: hp8924
Date: 2017-09-22 07:29:51 UTC
From: blaze_1024@...
Topic: 2622  Message: 2622

I'm wondering if anyone on the forum could provide a bin file of a blank HP formatted flash card.

What I'm looking for is an image file of a 4 megabyte PCMCIA card that's been formatted using an Agilent e8285a or an 8924C. It doesn't absolutely need to be blank if you have a card and the ability to create a bin file from it then I really don't care if there are files on it as long as it's not an HP read-only ROM card. It needs to be a RAM card writable by the analyzer.

Best Regards

Dan.

Topic: 2622  Message: 2624

What I need is a bin image file of 4meg PCMCIA card that's been formatted in an HP E8285a or even an HP 8924 and that's writable by the same machine.

What I don't need is an image of an HP ROM card because that's what got me into trouble in the first place. I used MCE to copy RFTOOLS bin image to a PCMCIA CARD that was previously writable by my E8285A. Since it was an Image of a ROM card it made the card read only kinda like when you copy files from a CD ROM. So far nothing has worked to make the card writable again by my E8285a. In retrospect, I guess I should have made an image of the HP formatted PCMCIA card before I copied the RFtools image ROM to it
. No matter what I do the HP still sees the card as a ROM card and refuses to format it, even erasing it with MCE has failed to make it writable by the Hp again.

I'm hoping flashing the card with an HP formated writable 4meg image of a PCMCIA card will reverse the process if not then this card is now useless for saving files to from the HP. Interestingly enough the Card is still writable by MCE but MCE cant remove the software write protection.

By the way, what is Elan software ?

Best Regards Dan

# 2625. Re: [hp8924] HP Formatted SRAM or Linear Flash card BIN file

Yahoo group: hp8924
Date: 2017-09-23 01:38:29 UTC
From: zl1cvd@...
Topic: 2622  Message: 2625

Format any SRAM card on a PC with FAT16 and the HP will read it. Mount the RF Tools BIN with PowerISO and copy the files from mounted BIN to FAT16 formatted SRAM card. Pur SRAM into E8285A and it will read it fine.

Linear flash is another story. use MCE to write the BIN to linear flash. As long as the card is in fact linear flash and supports +5V writing AND is larger than the RF Tools bin it will work. There are allot of flash cards out there that are NOT linear. There are allot that do not support 5V writing. There are allot of PCs that do not support 5V writing.

If you can't get it all going from this, you can buy for $40 a FLASH card with RF Tools on it. Price includes shipping globally by NZ Post air mail - 10 to 25 days not tracked. I sell them on eBay for $50. Note the RF tools I sell has been patched to allow it to run on E8285A & 8924C but still some of the scanner type programs don't like E8285A because it has no front panel squelch control. The program specifically looks for this to stop scanning. When it cant find it, it errors. However all the actual RF Tools programs run fine now - just an issue with the scanner program/s.

Okay, my bad, Elan software is MCE. I should mention that I'm using the Free Ricoh demo version, which seems limited to only writing BIN files. The newer versions of MCE seem to be more powerful and can actually read and write individual files to a PCMCIA Flash card.

You are correct my first post was contradictory. I was extremely tired when I wrote it and should have clarified that what I'm looking for is an image of an HP formatted 4meg PCMCIA Flash Card that's writable by the HP E8285a.

I'm hoping that flashing the card with an HP Writable image of a PCMCIA flash will make the card look like a writable flash card again and not a read-only HP ROM card. As it is right now the HP can see the files on it and load RFtools from it but can't write anything back to the card nor can it format it because it thinks it's an HP ROM card. Prior to flashing it with the RFtools bin Image the card had been formatted by the HP and was writable by it.

Dan

I have never been able to get any HP 8924 or E8285A to WRITE to and EEPROM card, only SRAM. So good luck and let us know how you did it if you crack it. Cheers!

Hi Chris,

I had no problem writing the Rftools Bin file to the Flash cards I have. I'm not actually sure what these cards are. They were in my computer laptop junk pile. I cant tell you how many times I almost threw away all those old laptops. But being your average electronics nerd didn't have the heart to get rid of it so I just stored it all in my storage trailer.

The cards I have, don't have any labels and no numbers just a metal top and bottom, and there is no write protect switch on them. When I put them in the HP it saw them as 4meg cards and formatted them. I was able to save and do recalls data from them.

The problem started after I used MCE to write the Rftools bin file to them. Ever since that point the HP sees them as a ROM card and will no longer format them. I've erased the card using MCE and still no luck. I was even able to flash the cards with the 2.04 firmware ROM and use them to flash the V2.04 firmware to the HP and it worked fine.

By the way, thank you for posting the RFtools image, I've been having a great time with it. The day I got it installed I ended up spending half the night testing coax assembly. I even tested an MFJ coax switch and confirmed what I always suspected and that is that it's a piece of junk. Every time I tried to use it on VHF and above my transmitters would fold back power. It had a huge impedance bump with a return loss of 9.5 at VHF and got worse the higher in frequency you went. On the other hand, the Alpha Delta switches I tested were absolutely beautiful, In my opinion, they are well worth the money. Now that I think about it maybe I should test those MFJ switches on HF and see how they perform

It also allowed me to confirm what I always suspected and that is most hams don't know how to properly solder a PL259 onto coax. I have collected a lot of coax runs from people who claim to be experts on soldering PL259's onto coax and now I can't wait to show them the screenshots of the Impeadence bumps their soldering job created. I've now seen soldered PL259's with Return losses of over 9 dB at 145Mhz.

I also learned that my crimped and clamped PL259s and BNC's have negligible Return loss. I always thought that the crimped connectors, as well as the clamped style connectors, were better and now I was able to prove it.

The distance to fault program which acts like a TDR is an amazing tool that no ham should be without. I was amazed when I compared some cheap Chinese coax against some good Belden coax. The cheap stuff had huge impedance bumps as high as 10.5dB return loss all down the run while the Belden coax was flat the whole run with the only impedance bums at the start and end of the coax.

By the way, if anyone is interested I figured out how to take screenshots while using Ibasic programs like Rftools.

I connected a laptop to the db9 connector on the HP and am able to use the software I downloaded to take screenshots of all the built-in programs like the Spectrum analyzer but was unable to take screenshots while any of the RFtools programs were running which was a

hugh disappointing.

I discovered that if you pause the Ibasic program by pressing the cancel button you could then take a screenshot. Once you have your screenshot you simple press the continue button using K1 and the program once again resumes right where you left off.

Once again I've been stuck in a wheelchair for over 6 months now and my neurosurgeon tells me it could be another year before I'm walking. My prescriptions are over a $1000 a month and my wife has had to take on a second job so I really can't afford to spend money on software or new PCMCIA cards.

Interestingly enough I am making a bit of money with the HP. I jokingly offered to scan coax for my ham friends for $5 a run, one of my friends thought I wasn't charging enough so he anounced it during a local net for $10 a run and I now have like 30 piles of coax in the shop waiting to be tested LOL !!! The only other tool I need to do it right is a hipot tester. Unfortunately, even though I would love to have one they are out of my price range.

Once again thanks for all your hard work and for posting RF tools online. I would have loved to buy it from you via ebay but I simply can't afford it right now. Maybe when I get back on my feet I'll send you a donation.

Best Regards
Dan

Hi Dan,That's rather confusing. As Chris says the HP 892x series radio test sets can't write to Flash cards. Your cards sound like flash as most SRAM cards have a battery and / or write protect switch. Again as chris says, try formatting one as FAT 16 in a laptop using DOS or Windows (not MCE) and see how that goes.
Robert G8RPI.

Okay now I'm confused, there doesn't seem to be any official ISO standard for PCMCIA memory cards or at least one I can find and the information on the web is contradictory or very confusing. The whole thing is a total Cluster screw up no wonder they abandoned the technology.

Anyhow like I said the cards have no labels on them and I simply assumed that all PCMCIA cards whether SRAM and Linear were called flash cards. So if I understand this correctly FLASH cards are eeprom type of memory.

Okay, that issue aside what's the maximum memory size card the e8285a will support. It's not like I can afford to go out and buy one right now, I have another $3500 MRI scheduled and my insurance only covers the first $2000 so I'm on the hook for the remaining $1500 and this will be my third MRI in the last 6 months ARGG.

The worst part of these MRI's is I can't lay down flat for the procedure so they have to put an IV in and feed me morphine throughout the entire procedure and that costs yet another $500 but hey at least I can keep my eyes open for another card and budget for it.

This whole back thing is really pissing me off, just 6 months ago I was jogging 5 miles a day and working out in the gym helping my son get ready for Basic training, He has since graduated Basic at Fort Benning and is now in Ranger school. Meanwhile, I'm still stuck in this damn wheelchair and I'm not allowed to lift anything over 5 pounds. Trust me that's a hard pill to swallow and I always forget.

The last time I forgot I ended up in the emergency room. Without even thinking about it I tried to move an O-scope that was in the way of my wheelchair. I kept bumping into it so without thinking I just grabbed it and tried to move it.

Thankfully my wife was home, she came running and found me passed out. That little mistake cost me an ambulance ride, an emergency room visit another MRI, an ultrasound of the arteries in my legs and 4 days in the hospital.

The only good part of being in the hospital is they keep you pumped full of morphine, It was the first time in over 5 months that I actually slept for more than 20 minutes at a time. I still haven't gotten the bill for that mess but I guarantee that even with insurance it's going to cost me more than the Siglent SSA3021X-TG spectrum analyzer I've been drooling over.

Anyhow sorry for the long rambling post, I've been up since 3am, it's now 5am and there's nothing to do here other than watch TV or type on the computer.

By the way, I got really lucky, A local ham who's also an RF engineer gave me 6 beautiful Agilent 8491B N connector attenuators, two 3db, two 6db and two 10db and all 6 had calibration tags less than 2 months old which plotted and listed the actual attenuation.

He also gave me a couple of really nice Mini-circuits combiners-spliters which cover different frequency ranges. and he gave me a hand full of coax jumpers made from RG-400

with silver plated connectors, I think they might be Agilent parts as they all have white labels with part numbers printed on them. They have N connectors on one side and SMA or BNC on the other and several have N connectors on both ends.

Anyhow Best Regards
Dan

Hi,The OP seemed to disappear after questions were asked. They said they had prototyped a working PCMCIA to USB stick converter but did not say how. As they are so different there would have to be some kind  of intelligence between them. I think it was a pipedream.If you want a LCD display use one of the Gonbes GBS82xx boards and either an external monitor or fit one of the small LCD + driver board kits that are sold for car use like http://www.ebay.co.uk/itm/VGA-AV-Reversing-LCD-Controller-Board-5-6inch-TFT-AT056TN53-640x480-LCD-Panel/371075775010 you need to check the ptysical size and fit. They do larger ones.

Even though I really like the look of vintage EL screens I don't like the replacement costs nor the burn-in issues. So I really like the idea of using an LCD screen rather than replacing the EL display. I'm wondering if anyone has managed to fit one of these inside the case where the EL screen is normally mounted or do people normally mount them outside the case?

I was thinking about going the GBS8200 route and trying to mount the LCD inside the case. even though there's probably enough room inside the case for the GBS8200, I think I would rather mount it outside the 8285 in its own separate case and then mount a dedicated BNC or VGA or even HDMI on the back of the 8285 case. This way I would have easy access to the GBS8200.
Also, I'm not sure how susceptible the e8285 would be to RFI being generated by a foreign device being mounted inside its case. Most of my experience with Chinese made stuff is that they're RFI nightmares.

It's Just a thought, personally, I think the 8285 would look sexy with a color LCD mounted inside the case. It would be nice to be able to easily change the display colors. That way when you get tired of green you could switch to whatever color you like.

# 2635. Re: Flash card experiment

Yahoo group: hp8924
Date: 2017-09-30 21:49:53 UTC
From: blaze_1024@...
Topic: 945  Message: 2635

Hi, Joe.

I know this is an old post but there seems to be a serious lack of information regarding HP's compatibility with these cards. So now I'm confused I thought the E8285 could read and write to linear flash. I have a chance to pick up a 4mb linear flash card for $10, I guess the only way I will find out is to actually buy one and see what I can figure out.

I'm out of memory on my test set and still have tons of test configurations I need to store. I hate manually reconfiguring the test set every time I need to do a test. It's just so much simpler to set it up once and save the setup for future recall. The other issue is the limited filename length makes it difficult to assign names to test configurations that make it easy to remember what they do. so I've started a spreadsheet that lists all the test configurations I've programmed and what they are intended for.

So the question of the day, Does the e8285a actually support read-write to Intel series 2 linear flash cards.

Hi,No, none of the HP comms test sets can write to Linear Flash PCMCIA cards or other FLASH or EEPROM cards. They can only write to RAM cards. Writing to "Linear Flash" cards can be an issue in any case as there a many variations in them. First is if they need 12V or just 5V then some have different memeory configurations.Best to get a NV RAM card and then back it up to a PC. One other option if you have HPIB connected is to use a external drive simulator like HPdrive http://www.hp9845.net/9845/projects/hpdrive/

Ahh of course - you are right!

The inbuilt signal generator officially only goes up to +3dBm. Using a second power meter I saw a maximum of +7dBm output.

Cheers,
Matt

That's slick, You did a great job. I really like the green on black display. Other than looking nice it's also easier to read, the Human eye is most sensitive to green light which really helps if your vision isn't up to par.

I'm definitely going to do this with the E8285a. Even though LCD's aren't nearly as prone to burn in as other types of displays I really wish there was a way to implement a screen saver as I sometimes leave my test gear powered up all day and I just prefer if the screen would power down, I might consider implementing an external switch to turn off the display.

I haven't had much time to study the E8285 service manual so I'm not sure if and where and I can pick off a suitable video signal inside the unit.

# 2641. Latest version of 8924 software

Hi all,

What is the latest version of 8924 software that is available? I have an 8924C with A.08.04 and I would like to know if there is anything later available to upgrade to?

I assume the upgrade is loaded onto a PCMCIA card and run from there?

Cheers,
Matt

Topic: 2641  Message: 2643

I think you are confusing this with one of the follow-on products to the 8924C which did limit the frequency range on the Agilent version/later firmware vs. the HP version / older firmware. There are a number of threads about this in the group.

The version you have looks fairly late ...I have had a number of 8924C's and 8.XX was about the latest I had seen. Most are in the 6.XX range which is the one I have on the bench now.

For what the 8924C is used for anymore doubt that updating the firmware would help much since I suspect the changes were mostly around the cellular functionality which is obsolete anyway.

# 2644. Re: Latest version of 8924 software

I have 3 of the 8924C units.
One has the A.08.04 software with a copyright of 1990-2001 and Agilent Technologies on the screen.
The other 2 have A.06.03 software and copyright of 1990-1999 and the HP on the screen.
I have not paid much attention to the units to see if there is any difference in them for the analog portion.  As the cell phone is out of date and I never used them for cell phones (they were long gone when I got the 8924c).

# 2648. HP 8935 E6380A CDMA version

Yahoo group: hp8924
Date: 2017-12-05 18:45:23 UTC
From: Ralph
Topic: 2648  Message: 2648

Hi all

I have a HP8935 that has lost its programing. What I mean by that is it boots and passes all self tests.

The normal screens show up but it does not generate or receive any signals.

The tcxo does generate 10Mhz.

This started after I replaced the switcher supply which had failed. I was able to purchase a replacement on ebay.

All voltages check out.

I think the memory battery is bad and when I replaced the supply I had to disconnect the backup 3 volt battery that

Is mounted on the rear of the the unit. When you unplug the connectors, you disconnect the battery.

The card in question I believe that holds the Ram data including IBasic, RF Tools is "Memory/SBRC assy A2A30.

The memory battery is a CR2477 solder tab style that is no longer available. I have found others that will work.

I will order a new one./

My question is does anyone have the software available on a PCMCIA card and instructions for loading/saving same.

Thank you for reading

Ralph,

Sorry that I don't have the firmware backup.

I am not sure that loss of the firmware necessarily reflects an issue with the memory card. I had a backup battery issue and I replaced the coin cell on that card -- installing a socket for the replacement as there was plenty of room. The first time I powered the unit up again, I noticed that it automatically reloaded the data. Also, there is a jumper on the memory card for the backup battery. When it is in the "off" position, the unit works normally except that it reloads data every time and won't save the user specified data.

If I recall, there is also a backup battery on another card -- the CPU card I think. Maybe that one affects the firmware? I don't know.

Ralph. The firmware for this and all models in the series (8935, E8285A, 8920, 8921, 8922, 8924) is stored in EEPROM. Replacing battery backup batteries will not cause the error you describe. The backup battery only holds some screen defaults / settings and such. Its certainly not an Icom transceiver which looses everything when power is lost to its SRAM!

A prior setting could possibly stop some functions from working - pressing preset should clear that.

If you have changed the power supply, then the most likely cause is the PLL's are not locking on various modules (HP Calls this "Out Of Lock" OOL LEDs) - probably due to a voltage rail being out, a dry cap pulling supply rail/s down or a tanalum being a pig. Can even be caused by modules being moved - dust and such on the connectors. The first thing I always do is remove everything and get stuck in with a vacuum cleaner. Then compressed air. Then clean all those connectors. 1/2 the time this fixes the problem.

Grab hold of the E6380-90015 E6380A Assembly Level Repair manual and work your way through Manual Trouble Shooting Procedures Page 75.

There does not seem to be a group dedicated to the IFR equipmant other than one that does not seem to be very active.

I was hoping that someone here may be familiar with the IFR 1200S and could answer a question I have.

On the back is a BNC for the time base. The book says it switches automatically from in to out. It does not seem to say how much I need to drive it with.

The object is to feed it a 10 MHz signal from one of the GPS type of time base signals.

I have a 8924C and tried feeding it in but the GPS signal is some what jittery and the 8924C will take that signal,but the output jumps around about 100 Hz at 999 MHz out of the 8924c.

Your problem appears to be more to do with an unstable GPSDO output than the input level of the IRF 1200S.

I see from a posting from Dave N8IT that the input required is in excess of 5V p-p, Most GPSDO's give either a sine wave output or a TTL logic level output which is under 5V p-p.

The phase jitter on the cheaper GPSDO's is horrendous.

Thanks to Dave about the 1200s needing the 5 volts.  I don't have that much and probably will not build an amp to boost it up.  That seems to be about 1/4 to 1/2 of a watt into 50 ohms.Did not want to put in too much and blow something out.
The inexpensive GPSDO I am using was from someone on ebay that pulled it out of a new drone. One of the NEO 7 modules.  I think I paid about $ 9 for it.  Looking at it with a S/A the 10 MHz signal is very dirty.  This unit has an output pulse that looks sort of like a sine wave with bumps in it.  It feeds a LED and the frequency can be set from about 1 Hz to around 10 MHz.  When I first saw the units I thought it might be possible to set them to a frequency and use them instead of a crystal to drive an FM transmitter.  After looking at the wave for with a SA I decided that would not work for me.  I did want to use them as a GPSDO to set frequencies.
I did use the oscilloscope method of feeding a 100 MHz scope channel 1 with the GPSDO and the other channel with the 10 MHz out of the 8924c and just triggering with channel 1.
Doing that to 2 of the 8924Cs and then hooking them together showed them to be right on at 999 MHz with the last digit blinking from a 0 to a 1.
That should be good enough for ham work..
Thanks and 73 to all.

Subject: Re: [hp8924] OT IFR 1200S

Your problem appears to be more to do with an unstable GPSDO output than the input level of the IRF 1200S.

I see from a posting from Dave N8IT that the input required is in excess of 5V p-p,  Most GPSDO's give either a sine wave output or a TTL logic level output which is under 5V p-p.

The phase jitter on the cheaper GPSDO's is horrendous.

Thanks Dave.  I was probably thinking of 5 V rms.
The 18 dbm will be easy for me to see on the 8924c.  One of the China amp blocks may make that for a few bucks if I ever decide to try that. I think the module I have will do about 0 to 3 dbm.

The IFR 1200S is looking for a TTL signal or similar level sinewave.The "on-board" frequency generators provided by the latest GPS module are no substitute for a GPSDO. Best method is to trigger the 'scope from the 1pps output with the units 10MHz on the other channel and adjust the units internal oscillator for zero drift of the waveform. This assumes it's already close to 10MHz .

This is probably a dumb question:
I hooked up a RF bridge to my HP 8935 service monitor and get a lot of peaks and valleys on the return loss using high quality 50 ohm loads. 0-1GHz.
A good quality coax between Duplex and RF input or antenna input gives a straight line on spectrum analyzer.
I did not go through the RF tools calibration since I do not possess all the necessary parts such as the attenuators and RF power splitter.
The RF bridge works fine on my Marconi spectrum analyzer 0-400 MHz and has been tested to well over 1 GHz on other spectrum analyzer.
Is this normal??

Hi Wally,

Did you place 6 dB pads in the cables from the 8935 DUPLEX OUT and ANT IN sockets to the bridge input and output, respectively?

I do not have this problem with an Amtronix return-loss bridge. I use the 6 dB pads as shown in the mimic diagram on the screen.

Hi,You do not need to use the 6dB attenuators. They improve the match of the test set's ports and thus overall performance if you have a good bridge. You do need to run the calibration if you are using RF tools. You just need an open, short and load. As it's not a vector analyser homemade open and short are OK, but the load should be the best you have. If you run the test set as a "live" SA and TG with the bridge you don't need calibration other than to set the amplitude scaling.

Hi Wally,

Yes, they are most definitely required, so as to present both the 8935 and the bridge with a known resistive load and to provide isolation between the instrument and the bridge.

RF Parts has JFW N-type fixed pads at reasonable prices. Mini-Circuits also offers N-type fixed attenuators which are fairly inexpensive. Careful shopping on eBay (look for quality brands) is also an option.

From the IFR FM/AM-1200S/A manual, Revision 2 dated May 15 1987 that I have:

A level detect circuit determines when an external 10 MHz reference signal of sufficient amplitude is present on the External Reference Connector and responds by deactivating the TCXO and coup1es the external 10 MHz reference signal to the frequency divider.

When an external 10 MHz reference signal exceeding 5 V p-p is applied through the External Reference Connector to NAND gate U2802, a level detector , consisting of op amp U2801 and associated components, produces a constant high, turning off 42801 and interrupting power to the TCXO. The high output of U2801 is also fed to U2802, passing the external 10 MHz reference signal to the frequency divider circuit.

Hi. they are conductive rubber type. First thing to try is dis-assembly and gentle cleaning of board and rubber pads. I use a lint free cloth moistened with IPA. Don't apply solvent directly you carbon loaded surfaces unless you are sure they are compatible. If that does not work you can get conductive paint to put on the rubber pads. search for TV remote control button repair.

HTH,
Robert G8RPI.

You may want to look at this You tube video on the supply.  Often it is just a few capacitors that need replacing.  I have replaced some in one of mine to get it going.  I think in the files section here is a guide to replacing some of the capacitors.
There are some cautions about not running the 8924 with the cover off for any long period of time.

HP 8924C Power Supply Problem Repair

|

|

Take the feet off the back and several other screws you will see.  Then remove the handle straps on each side.  Under them is about 6 or 8 screws on each side.  The top should slide off the back.  Remove the cover on the back side where the supply is located. Lots of screws there. There are some screws holding the supply to the case.  There are 2 plugs to the supply.  Remove them and the supply should be free to come out.  You probably can pull the supply up to remove the plugs.
Try to keep up with which screw comes out of which hole.
A power screwdriver of some kind will be a big help as there are lots of screws.  Mostly two sizes of the torx type.While the case is off you may want to take an air hose and blow out some of the dust.

Gentlemen: I do not know if this will work on these specific buttons, but here is what I did on my TV/DVR control buttons>>>

Went to Harbor Freight and bought a roll of aluminum tape. About eight bucks. Way too much tape.
Got a paper punch that cut small circles or dots. Punched out some dots.
Took off the paper backing to expose the glue side of the aluminum tape.
Put the dots on the carbon buttons.
Rubbed a bit with a smooth instrument to assure good stick.

Worked like a charm.

I tried just gluing aluminum foil to the conductive dots but could not find an acceptable glue. Some dots kept falling off. However this worked if the aluminum stuck.

I do not see the original post and nothing was quoted, so excuse me if I have missed the mark.

To properly repair the rubberized, carbon switch buttons, you use a kit designed to fix these.
Usually sold to repair PC controllers and TV remotes.

MG Chemical 8339 is one such repair kit.
This is available via Amazon and Digi-Key and probable others.
A search for membrane switch repair provides many hits.
The use of any of the stick on repair kits could cause a problem when the stick on part fall off.

Glenn

Thanks to everyone who responded. I believe I blew two TVI protection diodes on the RF I/O assembly.They are 6V8A zeners at 5,8 V.They short to ground, There is no output from duplex or RF but ant in works OK, so these protection diodes may explain the fault.I did have the assembly level repair but not the old clip, which may help.Anyone know of a source for the diodes that does not involve ordering 100 or waiting for china delivery?Wally KC9INK

I recall ordering some diodes from mouser or digikey. The 8920 CLIP covers things common like measurement, audio, IF, synth, spec an, etc. But not duplexer, cpu, ram, PSU. The assembly level is available for all models. Like the one sent by kb9jzy. So for an exact list, you'll need do some digging. Also, the block diagrams in the assembly level manuals for all models is good to have a look at as some give more details than others - for the same module. Good spotting & please report back with the exact fix is for out combined future reference. 73s om de chris zl1cvd

Upon further investigation, the protection TVI diodes are OK. Removed one, tested and reinstalled. Appropriate voltage for Zener of about 5.8. However, I did order some though through a US source.
Here is my problem, I will try to be succinct.
The unit powers up without any error codes at all.
It does not put out any signal.
It does receive OK about 1.5 Dbm low. Frequency readings are OK.
The signal out does show up on the spectrum analyzer and varies somewhat with Dbm settings.
There is RF signal into the board that does vary a bit with the control.
Apparently the unit does have some control of the RF input to the I/O board and further signal strength changes are made with the attenuator.
Both relays on the RF I/O board or powered on no matter what. Changing input or output from RF I/O to antenna or duplex does not change the approx 5V control to the relays They do appear to work, turning on and off with a 5 V applied voltage with unit turned off.
The DC voltages on the attenuator are not varied with changing the Dbm strength of the signal.
On running RF tests on the machine, the voltages on the attenuator are likewise very wrong.
It appears as though there are no control signals going into the RF I/O board or something on the board is not interpreting the signals.
The voltages on the various attenuators does not change at all.

That is why I was looking for a schematic so I could identify the pin that would have the signal. Maybe the input to control the attenuators is not there or just wrong? Or a bad chip on the I/O board? Or maybe a bad EEPROM that stores attenuator settings? If I could analyze the attenuator signal coming in I might get closer to the problem.
The old schematics have I/O boards very different from the 8935.
Any suggestions?
I would try another I/O board but they are very expensive.

# 2688. Using external VGA monitor

Yahoo group: hp8924
Date: 2018-05-13 17:21:27 UTC
From: Paul Holm
Topic: 2688  Message: 2688

Hello,

Well, I made the mistake of turning 50 and now the display is getting harder to see. I'd like to connect an external monitor as some of you have done in the past. I looked at the group Files section but it is empty.

I have sifted through the archived messages but would like to know what the current thoughts are on this, using the converter boards that are presently available.

I've seen references to devices like this that are plug and play(?):

<https://www.ebay.com/itm/GBS-8219-XVGA-Box-CGA-EGA-RGB-RGBS-RGBHV-to-VGA-Monitor-Video-Converter-US-Ship/292409359883?hash=item4414f4be0b:g:NxgAAOSwaMhZydK3>

and also for 8200/8220 boards such this one that are far less expensive, but may(?) require some mods to achieve sync:

<https://www.ebay.com/itm/Video-Converter-CGA-EGA-YUV-RGB-TO-VGA-Arcade-Jamma-Game-Monitor-to-LCD-GBS-8220/172948685209?hash=item28448b8199:g:8CYAAOSwj99Z8con>

Is this still pretty much where we're at with connecting external vga monitors? or does anyone have any recommendations? Thanks.

73 Paul - KCØHST

You can use one of those converter boards and a sink chip if you want to do the soldering work and modifications or if you want you can get a Sony digital converter box there about $100 you might be able to find one cheaper or more expensive on eBay you should be able to look in the list at my articles I did a article on these as this is what I am using, I do have the circuit board in sink chip modification to as a backup but you don't have to have this with the Sony converter

Seems the files are gone for me in the user groups.
YOu can get a GBS 8200 converter board off ebay for about $ 20 and do a slight modification to it.  You will need a power supply and box to put it in.  There are 4 SMD resistors to add to the board.
To use the GBS-8200 converter with the hp-8924c service monitor.
Obtain:
LM1881N IC sync seperator.1 UF capacitor--2 required680 K  ohm resistor
To be mounted on the GBS8200 board will be 4 SMD 50 K ohm resistors.  Without the resistors the display will seem to work for about 30 seconds and fade out. That is what it did for me.
On the LM1881 connect pin 1 to the # 4 (gray wire) pin of the 8 pin RGBS input connector.Pin 2 to a .1 UF capacitor and then to  the Green input of the 8 pin RGBS connector A wire from that junction goes to the input from the 8924C.Pin 4 to ground.Pin 6 has a .1 UF and 680 K resistor in parallel to ground.Pin 8 goes to 5 volts.Pins 3,5,7 are not used.
The 4 SMD 50 K ohm resistors are soldered across capacitors 29,32,33, and 36 on the GBS8200 board.  They are in a row between the 3 pots and an IC.
This will provide a green video output to a VGA monitor.

So sounds like an issue with A2A130 which unfortunately is unique to 8935 (E6380/E6381) series. Firstly, the most common failure in the entire series is electrolytic caps! most go dry. All will need changing at some point. Also have seen Tant caps cause issues too - some go short so look out for this too. So page 287 of the assembly level repair guide gives us a block diagram anbd you can see what those 2 relays are doing . So make sure your supply rails are spot on then go into the service menu (RF Diags, RF in/out) and see if you can manually switch RF paths. You should be able to trace back to the serial decoder chip - also make sure the chip is getting data. Another thing to consider is replacement module from Amtronix. Hes excellent and knows this series through and through. Let us know how you get on. 73s chris zl1cvd

Checked all the volts on input to the RF IO board. they are all OK. Checked all the bigger caps too.
I identified the silicon relays and one is working with - 8 volts control volts that switches between the control inputs. This relay that works is the one that switches from ant in to RF in. The unit does receive OK.
There is no signal out of the unit and the other silicon switches do not get the - 8 volt control. One of them gets a -8 V that does not switch to other control input.
I think that there is an IC that does this and cannot identify it. Cannot find where the neg 8 V control signal is coming from.
There are TTL waveforms that come into the unit, however I cannot really understand the intelligence. But no reason to think these are bad since everything else works.
There is a good signal coming into the RF IO unit about +12 to -2 dBM.
I think this is what the manual calls for, then the attenuators on the unit do the rest.
So far no luck with finding schematics for RF IO.
Thanks for the help.
Perhaps this is something I need Amtronix to fix for me.

Does anyone have a RF/IO board for a HP 8935? Part number E6380-61810, none on Ebay.
I know Amtronix does have them.

Alternatively I believe there are two parts on this board that are broken. I have looked quite a bit and cannot find either reasonable prices or reasonable quantities. There are some at reasonable prices($16) if I buy 16 chips (anyone want some?)

AC 438 MMIC RF switch alpha industries-skyworks. 8 pin surface mount chip.

SCX 6206TQM/V2, a PLCC44 chip. Probably a SCX6026 chip modified for HP.

Thanks in advance

Ordered the parts from:
www.moduletransistor.com http://www.moduletransistor.com/
They had both parts and took my money right away.
Never heard of them before.
When I get the parts in a week or so will report.
This might be a good source of parts.

Went to the website. No contact info, no location, no price, nothing really except a listing of parts like I get from one of the IC search engines. Those listings at least show who has it in stock and a price.

I'll pass

Took a few days but got E mails with tracking numbers. I paid with pay pal.Will let everyone know when the parts arrive ao do not arrive.I only used this company because they were the only one that had the parts and didn't want to sell parts at a large volume or at an unreasonable price.Wally KC9INK
